MELPHALAN FLUFENAMIDE (MELFLUFEN)

First-in-class peptide-drug conjugate (PDC) that targets aminopeptidases

Aminopeptidases are overexpressed in tumor cells. In multiple myeloma, increased aminopeptidase expression is associated with advanced disease.

- ✓ Reduce drug resistance
- ✓ increase tumor specificity
- ✓ reduce toxicity

Pre-clinical studies demonstrated the ability to overcome resistance to melphalan and novel agents

MELPHALAN FLUFENAMIDE (MELFLUFEN)

Peptide-conjugated structure of melphalan flufenamide

- Confers a high degree of lipophilicity
- Allows it to diffuse readily across the lipid bilayer membrane of the cell

Inside the cell

- Aminopeptidases and esterases mediate hydrolysis of the peptide bond and the ester bond, respectively
- Forms the hydrophilic alkylators melphalan and desethyl-melphalan flufenamide (Mel-pFPhe-OH)

O-12-M1

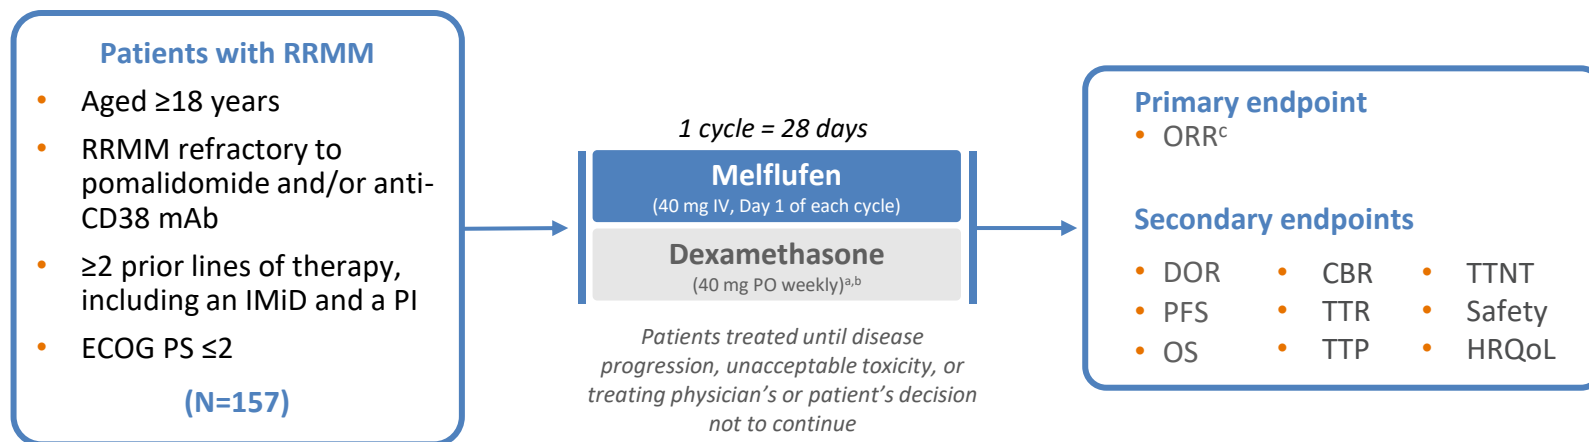

Open-label, multicentre, international, phase 1–2 study done in patients with relapsed and refractory multiple myeloma

- In phase 1 (23 pts) the established maximum tolerated dose was 40 mg of melflufen in combination with dexamethasone.
- In phase II (58 pts) dose-expansion portion of the study, the cycle length was increased from 21 to 28 days, providing additional time for recovery of the platelet and neutrophil counts

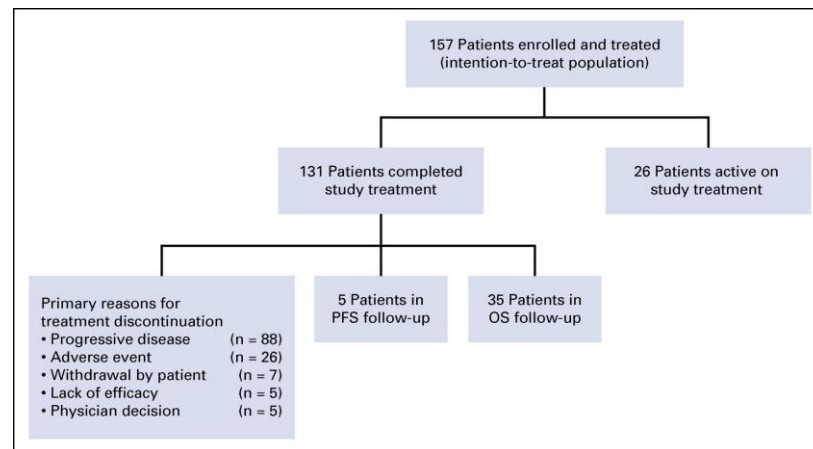

HORIZON (OP-106)

- single-arm, multicenter, phase II study
- melflufen plus dexamethasone in patients with RRMM refractory to pomalidomide and/or an anti-CD38 monoclonal antibody

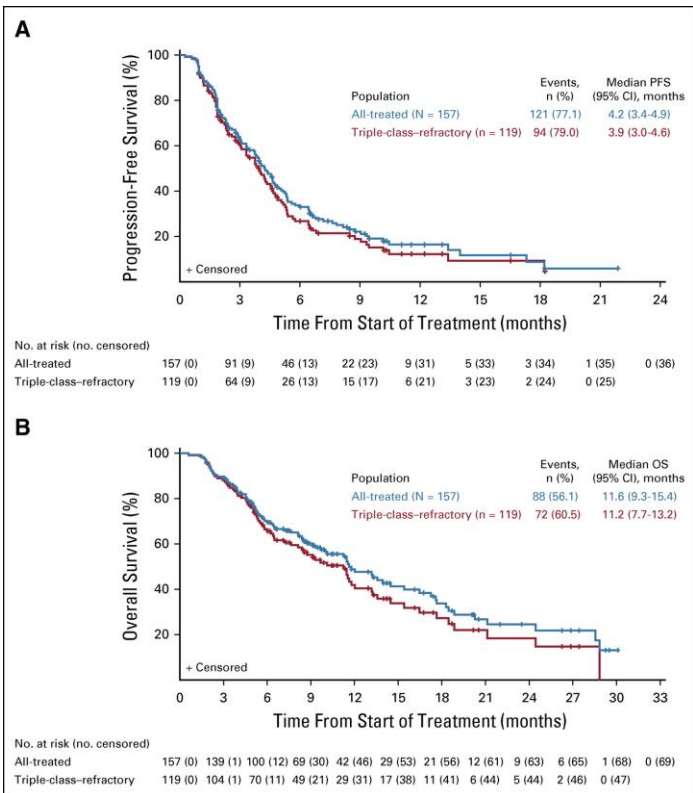

HORIZON (OP-106)

Characteristic	PTS
Median age	65 yrs (35-86)
Median previous LOT	5 (2-12)
Extramedullary disease	55 (35%)
HR Cytogenetics	59 (38%)
refractory to the last line	154 (98%)
triple-class–refractory disease	119 (76%)
refractory to prior alkylator therapy	92 (59%)

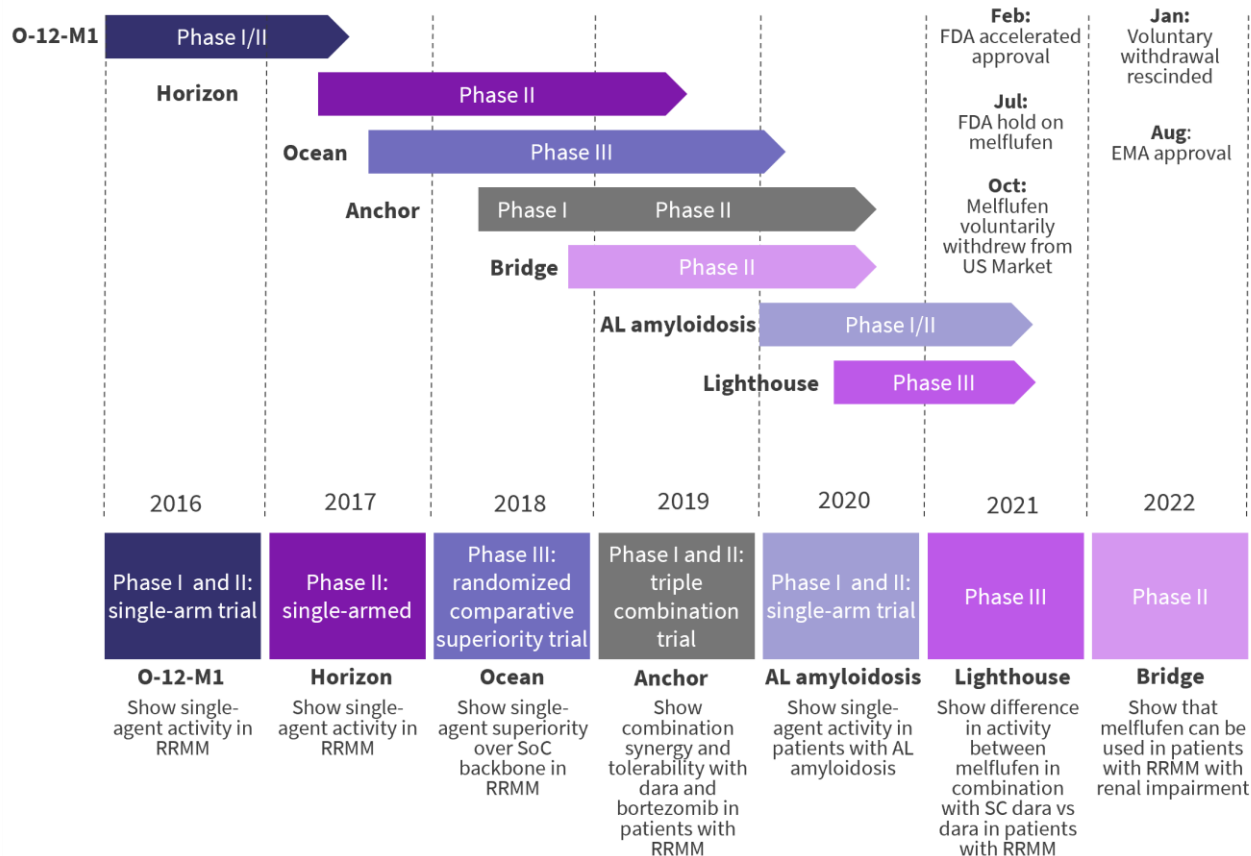

Response	PTS
ORR	46 (29%)
sCR-CR	1 (1%)
VGPR	17 (11%)
PR	28 (18%)
Median DOR (95% CI), months	7.6 (3.0-12.3)

HORIZON (OP-106)

Data cutoff date: February 2, 2022

Data cutoff date: February 03, 2022

Melflufen Received Full EMA Approval in August 2022

Melflufen in combination with dexamethasone is indicated for the treatment of:

Adult patients with multiple myeloma who have:

- 
- Received ≥ 3 prior lines of therapies and whose disease is refractory to ≥ 1 each:
 - Proteasome inhibitor
 - Immunomodulatory agent
 - Anti-CD38 monoclonal antibody
 - Demonstrated disease progression on or after the last therapy
 - For patients with a prior autologous stem cell transplantation, the time to progression should be at least 3 years from transplantation

ANCHOR (OP-104): STUDY DESIGN

Safety and efficacy analyses determined melflufen 30 mg to be the recommended dose in triplet regimens.

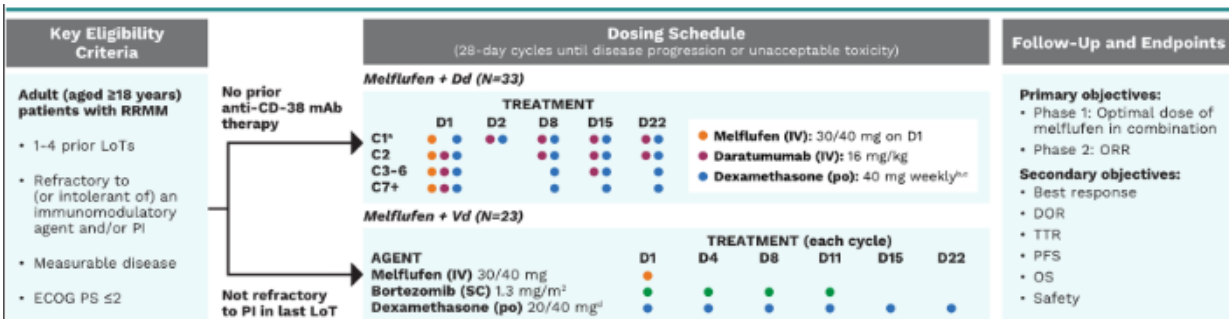

Figure 2. Melflufen + Dd: Overall Response Rate and Progression-Free Survival

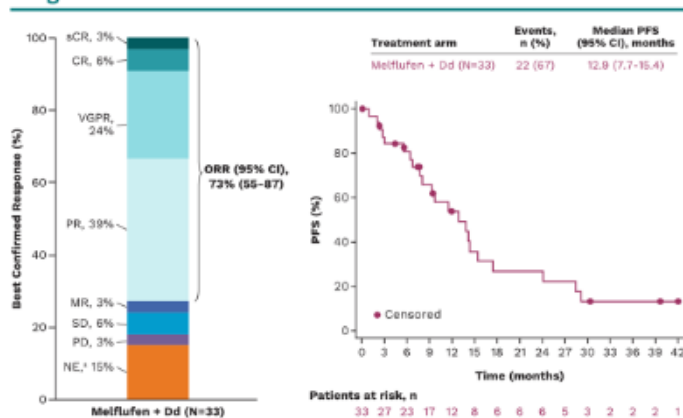

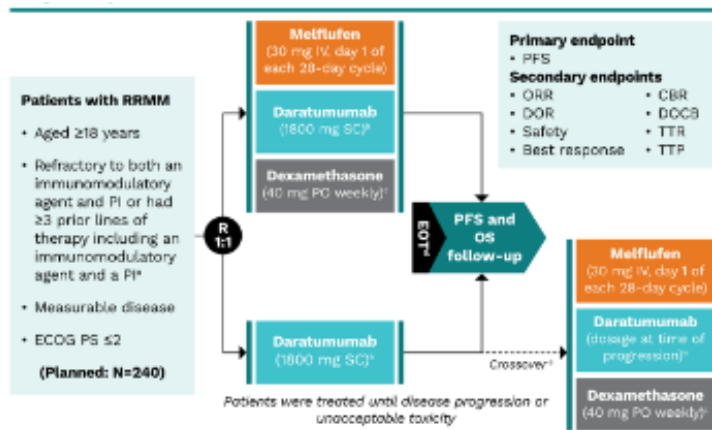

Figure 3. Melflufen + Vd: Overall Response Rate and Progression-Free Survival

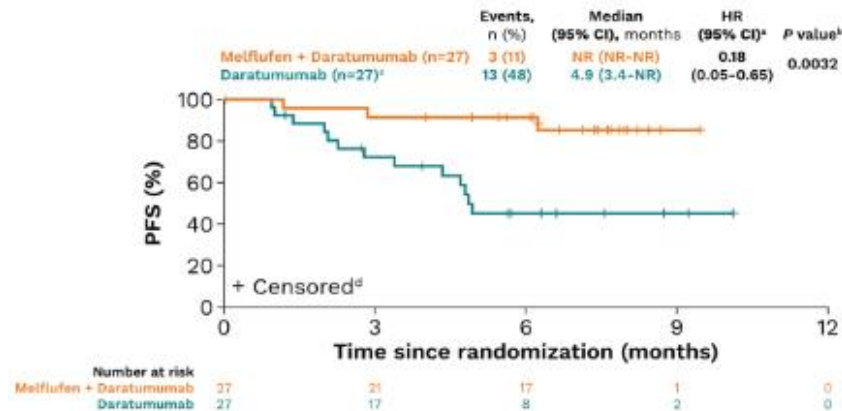

LIGHTHOUSE (OP-108): STUDY DESIGN

Melflufen + Dd showed superior PFS and ORR vs Dara, including in pts with no prior ASCT or with a TTP >36 mo after a prior ASCT, which resembles the population with confirmed benefit from OCEAN. The safety profile of melflufen + Dd was consistent with previous reports of melflufen

Response Category	Melflufen + Daratumumab (n=27)	Daratumumab (n=27)
Best confirmed response, n (%)		
Complete response	1 (4)	0 (0)
Very good partial response	4 (15)	3 (11)
Partial response	11 (41)	5 (19)
Minimal response	3 (11)	5 (19)
Stable disease	3 (11)	5 (19)
Progressive disease	1 (4)	5 (19)
Not evaluable	4 (15)	4 (15)
ORR (95% CI), %	59 (39-78)	30 (14-50)
Unstratified P value	0.0300	

MELFLUFEN KEY TAKE-AWAYS

Melflufen, in combination with dexamethasone, is indicated for the treatment of patients with TCR MM who have received ≥ 3 prior lines of therapy and who have disease that progressed on or after last therapy. For patients with prior ASCT, the TTP should be at least 3 years.

Melflufen enters the cell due to its lipophilicity. Melflufen is efficiently hydrolyzed by peptidases, and cytotoxic payload irreversibly damages tumor DNA and induces apoptosis.

Efficacy was demonstrated in **HORIZON**, and **confirmed** in **OCEAN**

PFS superiority over pomalidomide was shown in **OCEAN**, with a **trend towards a favorable OS** in the target population

Consistent safety profile in **HORIZON** and **OCEAN**, characterized primarily by hematologic adverse events that are clinically manageable and monitorable
