Immunotherapy in Hematological Malignancies 2024

Markers of T cell exhaustion and senescence correlate with impaired T cell killing and poor clinical outcomes

Immune effector dysfunction correlates with immune infiltration and with adverse-risk molecular features

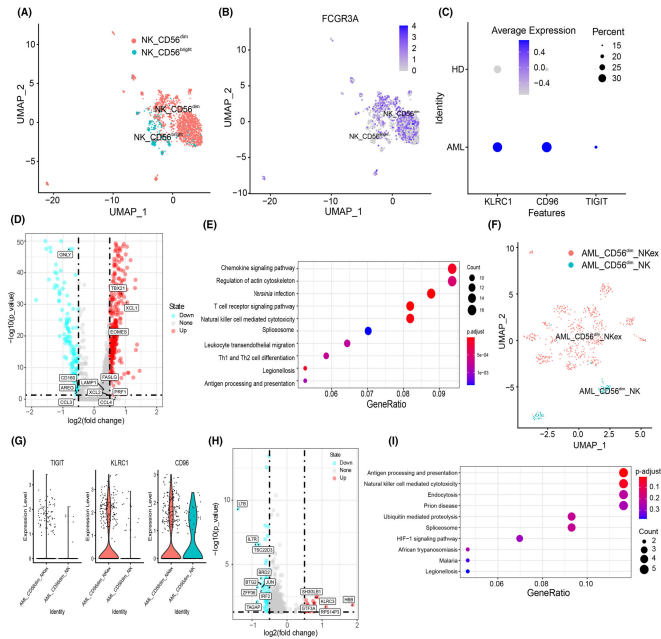

Rutella S et al, J Clin Invest, sept 13, 2022

Immunotherapy in Hematological Malignancies 2024

Single-cell RNA-seq reveals a microenvironment and an exhaustion state of NK cells in AML

Tumor-infiltrating NK cells display an exhaustion signature, as a consequence of triggered NK cytotoxicity.

This “activation-dependent exhaustion expression program” is very similar to the one reported for the induction of T-cell exhaustion

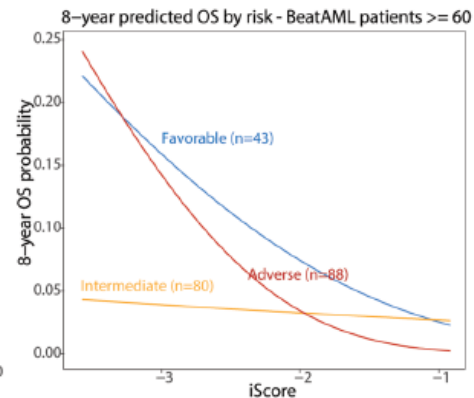

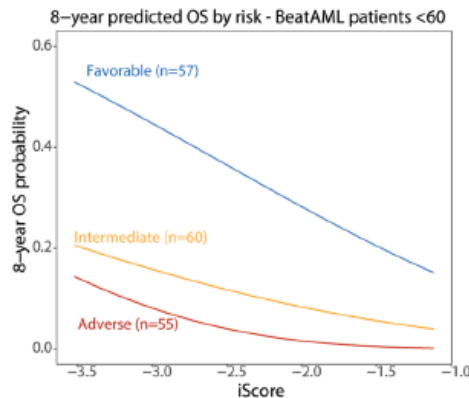

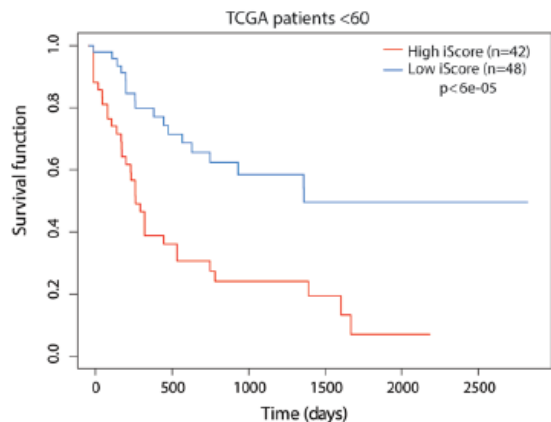

Zhang et al, Cancer Science, August 2023

Immunotherapy in Hematological Malignancies 2024

High inflammatory score is associated with adverse ELN risk group

High inflammatory score prognostically stratifies AML patients

Lasry A et al, Nature Cancer, January 2023, 27-42

Immunotherapy in Hematological Malignancies 2024

Atypical B cells and exhausted GZMK⁺ CD8 T cells are expanded in highly inflamed AML microenvironment

Asaf D. Yanir & Shai Izraeli Nature Cancer, 2023, pages 3–4

Immunotherapy in Hematological Malignancies 2024

Tregs in AML: is it time for immunomodulation?

Although the notion that Tregs immunosuppression represents a crucial point in AML immune microenvironment, the mechanisms underlying Tregs induction are still poorly elucidated and largely unknown.

Ustun C et al. Blood 2011;118:5084-5095

Immunotherapy in Hematological Malignancies 2024

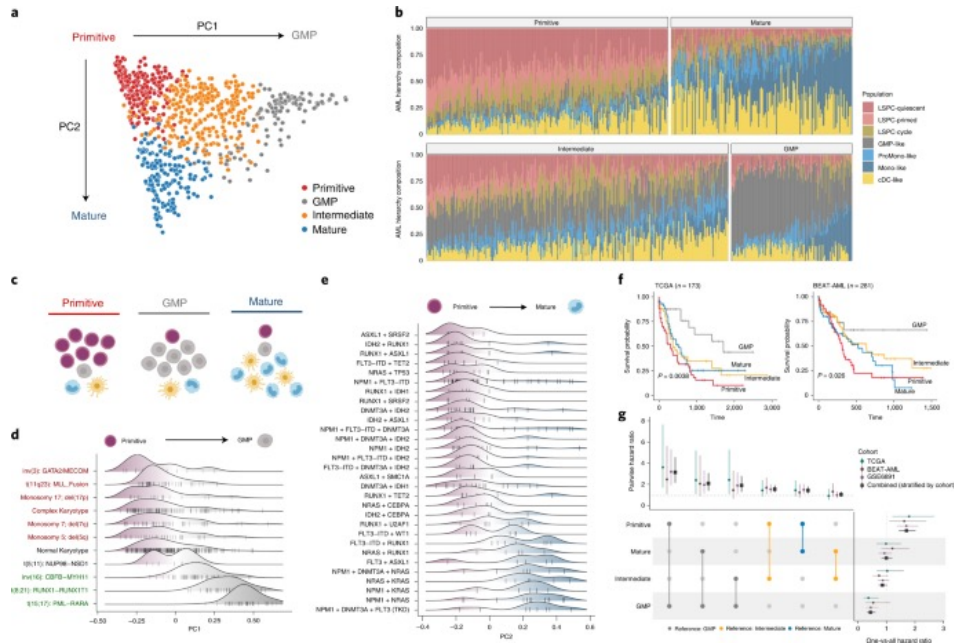

Antigen presentation safeguards the integrity of the hematopoietic stem cell pool

- HSPCs constitutively present antigens via MHC-II
- Presentation of immunogenic antigens results in the activation of CD4⁺ T cells
- Antigen presentation causes differentiation and depletion of immunogenic HSPCs
- This prohibits the onset of HSC-derived leukemias presenting neoantigens via MHC-II
- CD4⁺ T cells activated by HSPCs confirmed that they acquired an immunoregulatory and anti-inflammatory phenotype

Hernandez-Malmierca et al, Cell Stem Cell, 29, 2022, Pages 760-775

Immunotherapy in Hematological Malignancies 2024

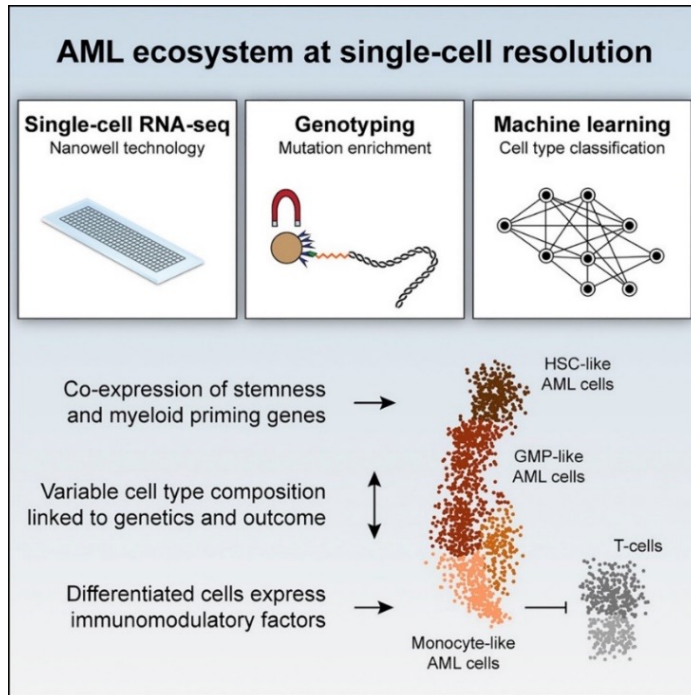

Hierarchy composition is associated with AML genomics

- Leukemia hierarchy composition is associated with functional, genomic and clinical properties and converged into four classes, spanning Primitive, Mature, GMP and Intermediate.
- Variation in hierarchy composition along the Primitive versus GMP or Primitive versus Mature axes were associated with response to chemotherapy or drug sensitivity profiles of targeted therapies.

Zeng et al, Nat. Med. 2022

Immunotherapy in Hematological Malignancies 2024

Single-Cell RNA-seq reveals AML hierarchies relevant to disease progression and immunity

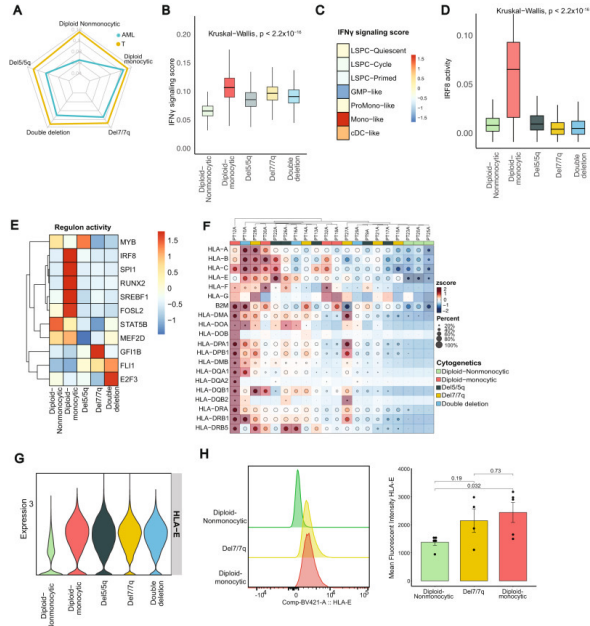

Seminal studies using single cell sequencing have revealed the clonal diversity and phenotypic heterogeneity in AML with greater precision.

Cell ontogeny and function of leukemic cells may impact T cell responses, as single-cell sequencing revealed that monocytic AML cells are associated with more suppressive T cell landscapes.

Van Galen P, Cell, Volume 176, 2019, Pages 1265-1281

Immunotherapy in Hematological Malignancies 2024

Comprehensive characterization of IFN γ signaling in AML reveals prognostic and therapeutic strategies

IFN γ signaling in AML blasts is dependent on phenotypic and cytogenetic groups.

- AML cells in patients with diploid monocytic AML had the highest expression of IFN γ signaling scores, correlating with higher expression of HLA-E, a non-classical class 1 HLA with regulatory functions
- Among nondiploid cytogenetic groups, IFN γ signaling activation was highest among those with del7/7q

Wang B. et al, Nat Commun. 2024; 15: 1821.

Immunotherapy in Hematological Malignancies 2024

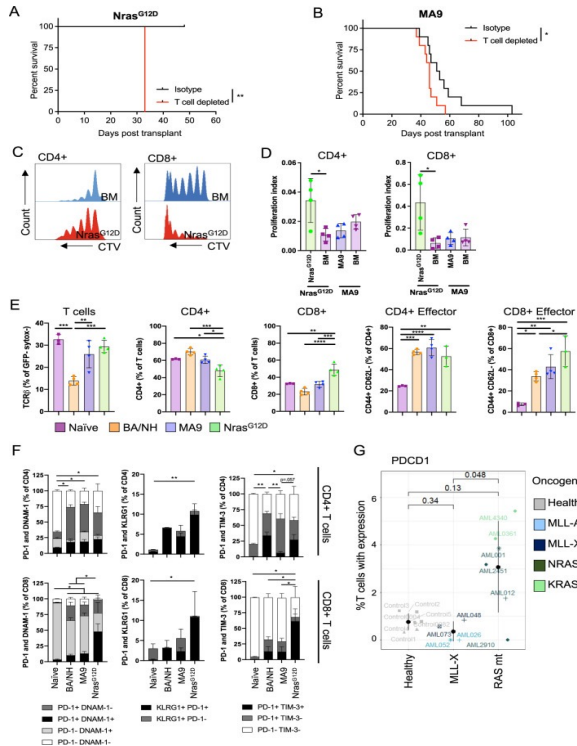

IFN- γ -dependent signals produced by AML cells modify MSC functions and favor an immune-modulating milieu

Corradi et al, Clin Cancer Res. 2022 Jul 15;28(14):3141-3155

Immunotherapy in Hematological Malignancies 2024

Oncogene specificity influences the type of immune response to AML cells

Nras^{G12D} recipients having a greater frequency of CD8+ T effector memory compared to recipients harbouring other mutations

Co-expression of PD-1 and TIM-3, indicating a T cell exhaustion phenotype, was increased on CD4+ and CD8+ T cells from *Nras^{G12D}* recipients

These data indicate expansion and dysfunction of the effector T cell compartment as a distinguishing feature of the immune microenvironment of immunogenic AML

Austin RJ et al, Nat Commun. 2023; 14: 2155.

Immunotherapy in Hematological Malignancies 2024

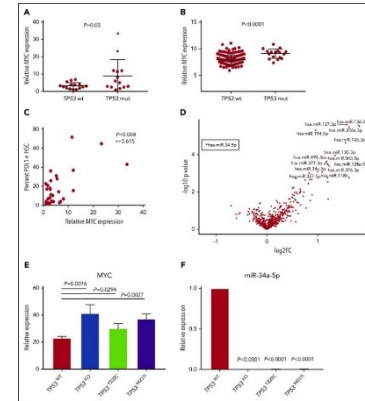

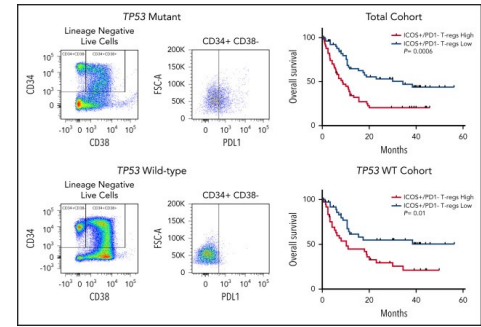

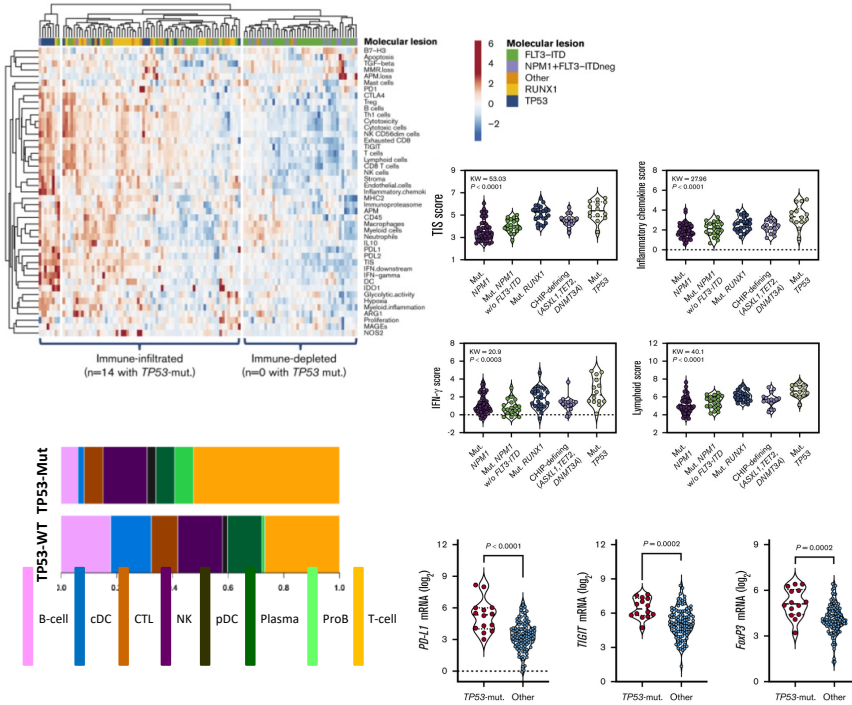

Alterations of tumor p53 status modulate the tumor immune microenvironment

- 1) T cells: effects on differentiation and functions
- 2) NK cells: desensitization and impaired functionality
- 3) Neutrophils: pro-inflammatory effects through recruiting cytokines and chemokines
- 4) Macrophages and MDSCs; promotion of macrophage immunosuppressive polarization and cell expansion

Efe G et al, Nat Cancer. 2024 Jul;5(7):983-995

Immunotherapy in Hematological Malignancies 2024

TP53mut AML patients show an inflammatory and immunosuppressive microenvironment

Immunotherapy in Hematological Malignancies 2024

Parallel single-cell metabolic analysis and extracellular vesicle profiling reveal novel vulnerabilities with prognostic significance in AML

- ✓ AML CD34+ cells displayed low ROS levels with both high glutathione (GSH) levels and mitochondrial functionality
- ✓ AML CD34+ cells at diagnosis are highly dependent on glucose oxidation (contrary to immune cell subsets) and prone to exploit glycolysis for energy.
- ✓ The phenotype of circulating EVs from AML patients shows high expression for stem cell markers such as CD44 and CD133-1
- ✓ EV^{AML} partially modulates the redox metabolism of CD34+ LSC-like cells through GSH/GPX4 axis
- ✓ Quantitative lipidomic analysis of EVs may support risk stratification for AML
- ✓ EV^{AML} improve the engraftment of human cell line MOLM-13

FLT3-FL signaling in normal hematopoiesis

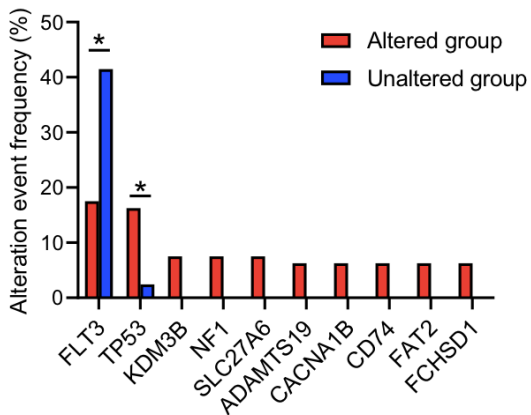

Panagiotis T. et al, Int. J. Mol. Sci. 2017, 18, 1115

Immunotherapy in Hematological Malignancies 2024

FLT3 mutational status frequently associates with immune dysregulation pathways

Correlation between DEGs in IFNG^{high} vs IFNG^{low} cases and FLT3 mutational status (*P<0.001)

Corradi G et al. Clin Cancer Res, March 29, 2022

Score values significantly different according to FLT3 mutational status

Ragaini et al, Blood Adv. 2022 Jan 11;6(1):87-99

Among FLT3 wt: the score remained statistically significant

Immunotherapy in Hematological Malignancies 2024

AML Driver Lesions and Transcriptomics

A **Single-cell RNA-seq** study for the first time associated **AML-cell-type compositions/differentiation state** with the **Genetic Driver lesions** (single-cell transcriptomics and genotyping):

FLT3-ITD mutation resulted linked with abundant **progenitor-like cells**.

AML-cell-type composition was linked with consequent **immunological properties**:

Differentiated **monocyte-like AML cells** express diverse **immunomodulatory genes** and **suppressed T-cell activity** in vitro.

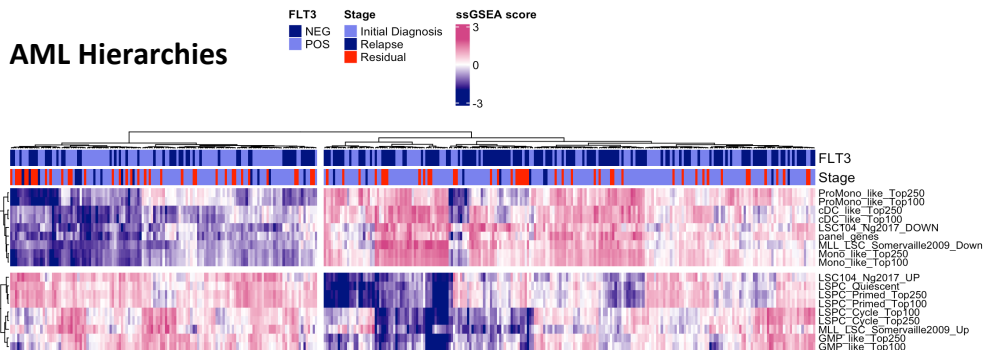

A complex interaction between AML driver lesion, differentiation state and immune stimulation

Van Galen P. et al, Cell, 2019

Immunotherapy in Hematological Malignancies 2024

FLT3-pos cases had a higher score in signatures associated with stemness and an undifferentiated state, whereas FLT3-neg cases with a more differentiated state

**FLT3-mut
Stemness**

**FLT3-wt
Mature**

Nanni J et al. manuscript in preparation

Immunotherapy in Hematological Malignancies 2024

FLT3-mutated AML has a lower immune score for CD8⁺ and CD4⁺ T-Cell function signatures: T-cell Activation/Effector function, Exhaustion and Interferon Response signatures

FLT3-mut
Cold

FLT3-wt
Hot but dysfunctional

Nanni J et al. manuscript in preparation

Immunotherapy in Hematological Malignancies 2024

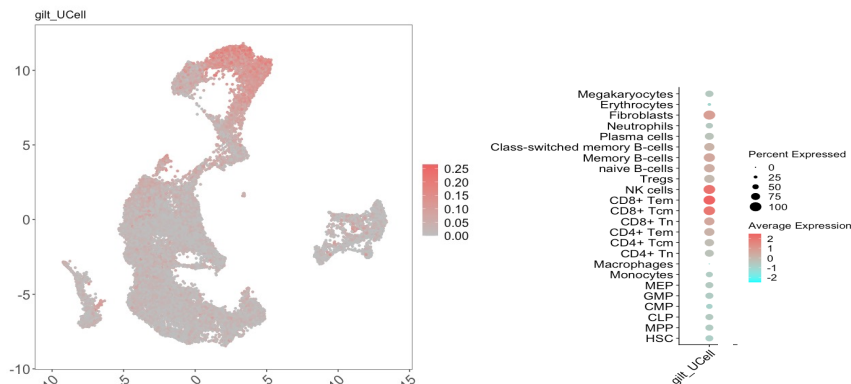

Response to Gilteritinib is associated with cell-extrinsic pathways involving T/NK immunity

Volcano Plot from DEG analysis

G Cohort: Sensitive versus Resistant

A higher expression of genes involved in T/NK function in Gilteritinib-Responders.

Mapping of the top 30 DEGs (R versus NR) onto the sc-RNA-seq AML dataset (Dufva et al. Cancer Cell 2020): we found that they were primarily expressed by CD8⁺ T_{EM}, CD8⁺ T_{CM} and NK cells.

Nanni J et al. manuscript in preparation

Immunotherapy in Hematological Malignancies 2024

Prognostic Impact of DEGs between FLT3^{mut} and FLT3^{wt}

FLT3 mutational status per se does not stratify prognosis
 (considering the group of FLT3-pos and FLT3-neg samples from BEAT-AML2 cohort which entered previous analyses);

Using *LASSO-penalized regression for feature selection* and mitigating data collinearity on DEGs between FLT3^{mut} vs FLT3^{neg}:

identified **46 genes** with non-zero coefficients

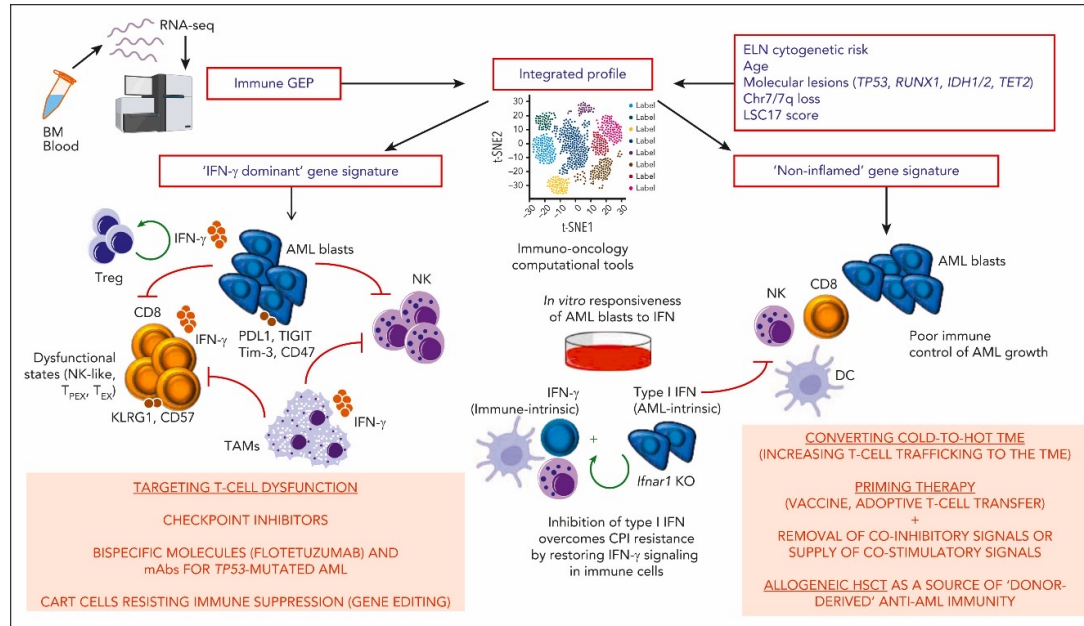

FLT3-PS: transcriptomic prognostic score

Nanni J et al. manuscript in preparation
