## EVIDENCE & INDICATIONS

### 6.3.1.3 Summary of evidence and guidelines for the management of low-risk disease\*

Summary of evidence	LE
WW or AS is SOC, based on life expectancy.	2a
All active treatment options present a risk of over-treatment.	1a

Recommendations	Strength rating
<b>Watchful Waiting</b>	
Manage patients with a life expectancy < ten years by watchful waiting.	Strong
<b>Active surveillance (AS)</b>	
Manage patients with a life expectancy > ten years and low-risk disease by AS.	Strong
<b>Selection of patients</b>	
Patients with cribriform or intraductal histology on biopsy should be excluded from AS.	Strong
Perform magnetic resonance imaging (MRI) before a confirmatory biopsy if no MRI has been performed before the initial biopsy.	Strong
Take both targeted biopsy (of any PI-RADS ≥ 3 lesion) and systematic biopsy if a confirmatory biopsy is performed.	Strong
If MRI is not available, per-protocol confirmatory prostate biopsies should be performed.	Weak

## NCCN Guidelines Version 4.2024 Prostate Cancer

[NCCN Guidelines Index](#)  
[Table of Contents](#)  
[Discussion](#)

### PRINCIPLES OF RADIATION THERAPY

Table 1: Below are examples of regimens that have shown acceptable efficacy and toxicity. The optimal regimen for an individual patient warrants evaluation of comorbid conditions, voiding symptoms and toxicity of therapy. Additional fractionation schemes may be used as long as sound oncologic principles and appropriate estimate of BED are considered. See [PROS-3](#), [PROS-4](#), [PROS-5](#), [PROS-6](#), [PROS-7](#), [PROS-8](#), [PROS-13](#), and [PROS-1](#) for other recommendations, including recommendations for neoadjuvant/concomitant/adjvant ADT.

Regimen	Preferred Dose/Fractionation	NCCN Risk Group (✓ Indicates an appropriate regimen option if RT is given)					Regional N1 <sup>e</sup>	Low Metastatic Burden M1 <sup>e</sup>
		Very Low and Low	Favorable Intermediate	Unfavorable Intermediate	High and Very High			
<b>EBRT</b>								
Moderate Hypofractionation <sup>c</sup>	3 Gy x 20 fx 2.7 Gy x 26 fx 2.5 Gy x 28 fx	✓	✓	✓	✓	✓		
	2.75 Gy x 20 fx						✓	
Conventional Fractionation <sup>c</sup>	1.8–2 Gy x 37–45 fx	✓	✓	✓	✓	✓		
	2.2 Gy x 35 fx + micro-boost <sup>d</sup> to MRI-dominant lesion to up to 95 Gy (fractions up to 2.7 Gy)		✓	✓	✓			
SBRT Ultra-Hypofractionation	9.5 Gy x 4 fx							
	7.25–8 Gy x 5 fx <sup>c</sup>	✓	✓	✓	✓			
	6.1 Gy x 7 fx <sup>c</sup> 6 Gy x 6 fx <sup>c</sup>						✓	
<b>Brachytherapy Monotherapy</b>								
LDR Iodine 125 <sup>c</sup> Palladium 103 <sup>c</sup> Cesium 131	145 Gy <sup>c</sup> 125 Gy <sup>c</sup> 115 Gy	✓	✓					
HDR Iridium-192	13.5 Gy x 2 implants 9.5 Gy BID x 2 implants	✓	✓					
<b>Boost Brachytherapy or SBRT with EBRT (combined with 1.8 Gy x 25-28 fx or 2.5 Gy x 15 fx)</b>								
LDR Iodine 125 <sup>c</sup> Palladium 103 Cesium 131	110–115 Gy 90–100 Gy 85 Gy			✓	✓			
HDR Iridium-192	15 Gy x 1 fx <sup>c</sup> 10.75 Gy x 2 fx			✓	✓			
EBRT + SBRT Boost	9.5 Gy x 2 fx for SBRT boost			✓	✓			

Note: All recommendations are category 2A unless otherwise indicated.  
Clinical Trials: NCCN believes that the best management of any patient with cancer is in a clinical trial. Participation in clinical trials is especially encouraged.

### Radical Prostatectomy Versus Stereotactic Radiotherapy for Clinically Localised Prostate Cancer: Results of the PACE-A Randomised Trial

Nicholas van As<sup>a,b,\*</sup>, Binnaz Yasar<sup>a,b</sup>, Clare Griffin<sup>b</sup>, Jaymini Patel<sup>b</sup>, Alison C. Tree<sup>a,b</sup>, Peter Ostler<sup>c</sup>, Hans van der Voet<sup>d</sup>, Daniel Ford<sup>e</sup>, Shaun Tolan<sup>f</sup>, Paula Wells<sup>g</sup>, Rana Mahmood<sup>h</sup>, Mathias Winkler<sup>i</sup>, Andrew Chan<sup>j</sup>, Alan Thompson<sup>a</sup>, Chris Ogden<sup>a</sup>, Olivia Naismith<sup>a,k</sup>, Julia Pugh<sup>b</sup>, Georgina Manning<sup>b</sup>, Stephanie Brown<sup>b</sup>, Stephanie Burnett<sup>b</sup>, Emma Hall<sup>b</sup>

- **Phase 3** open-label multiple-cohort RCT. In PACE-A, people with LPCa, T1-T2, Gleason $\leq$ 3+4, PSA $\leq$ 20ng/mL & suitable for surgery were randomised (1:1) to SBRT or surgery. SBRT dose was 36.25Gy/5 fractions in 1-2 weeks; surgery was laparoscopic or robotically assisted prostatectomy
- From Aug 2012 to Feb 2022, 123 men from 10 UK centres were randomised
- **Compared to surgery, pts receiving SBRT had better urinary continence & sexual bother score**; clinician reported GI toxicity was low but SBRT pts reported more bowel bother at 2 years

*The results suggest that stereotactic body radiotherapy may lead to lower rates of urinary incontinence and sexual dysfunction compared to radical prostatectomy, albeit with a potential increase in bowel dysfunction.*

## PACE-A CRITICISMS??....

“Can we therefore, on the basis of PACE-A, state the superiority of SBRT as the “best” local treatment for intermediate-risk prostate cancer?”

We do not believe that the present study provides sufficient evidence for such a statement, as many questions and relevant doubts remain, which in our opinion call into question the generalizability of these data

1. **INCONTINENCE:** the rate of 50% pad use at 2 yr after RP recorded here is difficult to understand, substantially higher than results from multiple RP series. The incontinence rates of 25-34% in the ProtecT trial after open RP were already regarded by many high-volume centers as no longer representative of a modern surgical approach.
2. **SEXUAL ACTIVITY:** In the cohort of men who were potent before RP, erectile function was preserved in 74% of men in the NeuroSAFE Group and in 46% of those in the non-Neuro- SAFE group ( $p < 0.01$ ). Again, such data are strikingly different to the post-RP potency data reported for PACE-A.
3. **RECRUITMENT AND END POINT CHANGING:** Finally, PACE-A did not reach its initial goal of recruiting 234 patients and was closed early after including approximately half of the study population initially planned.

<sup>d</sup> Department of Radiation Oncology, University Medical Center Utrecht, the Netherlands  
<sup>e</sup> Department of Radiation Oncology, Radboud University Medical Center, Nijmegen, the Netherlands  
<sup>f</sup> Julius Centre for Health Sciences and Primary Care, University Medical Center Utrecht, the Netherlands

- 100 Patients with intermediate-high-risk PCa were enrolled in the phase II hypo-FLAME trial.
- All were treated with 35 Gy in 5 weekly fractions to the whole prostate gland with an integrated boost up to 50 Gy to the multiparametric MRI-defined tumor(s).
- If the dose constraints to the normal tissues would be exceeded, these were prioritised over the focal boost dose.
- F-up 61 months

- ✓ At 5 years, the prevalence of grade 2 + GU and GI toxicity was 12 % and 4 %, respectively.
- ✓ The estimated 5-year bDFS was 93 %.

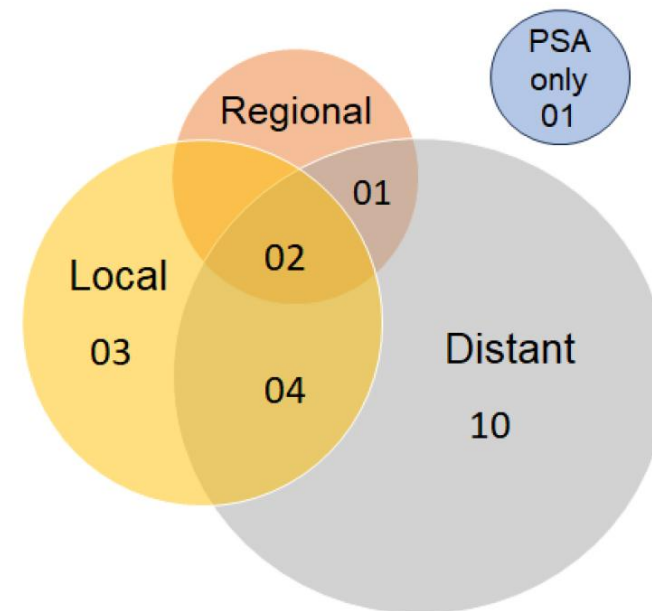

Ultra-hypofractionated focal boost SBRT is associated with encouraging biochemical control up to 5-year follow-up in pts with intermediate and high-risk PCa

## HIGH RISK (PELVIS SBRT) !!!!! **SHARP**

### Journal Pre-proof

Pelvic regional control with 25Gy in 5 fractions in SBRT for high risk prostate cancer: Pooled prospective outcomes from the SHARP consortium

Vedang Murthy MD , Indranil Mallick MD,DNB , Priyamvada Maitre MD , Gargee Mulye MD , Moses Arunsingh MD,FRCR , Luca Valle MD , Michael Steinberg MD , Thomas Kennedy MD , Andrew Loblaw MD , Amar U Kishan MD

- A total of 171 patients
- 35-26.25 Gy or 40 Gy in 5#
- Median ADT duration was 15 months
- Median follow up of 51 months
- Biochemical relapse in 11%(PETPSMA:3 pelvic relapses, other distant mets)
- Pelvic control was 98.2%, with 5-year BFFS and OS being 86.1% and 89.3%

**Conclusion:** For high-risk prostate cancer treated with SBRT, prophylactic pelvic nodal RTwith 25Gy/5# achieved near universal regional control

## RCT: MIRAGE UPDATE

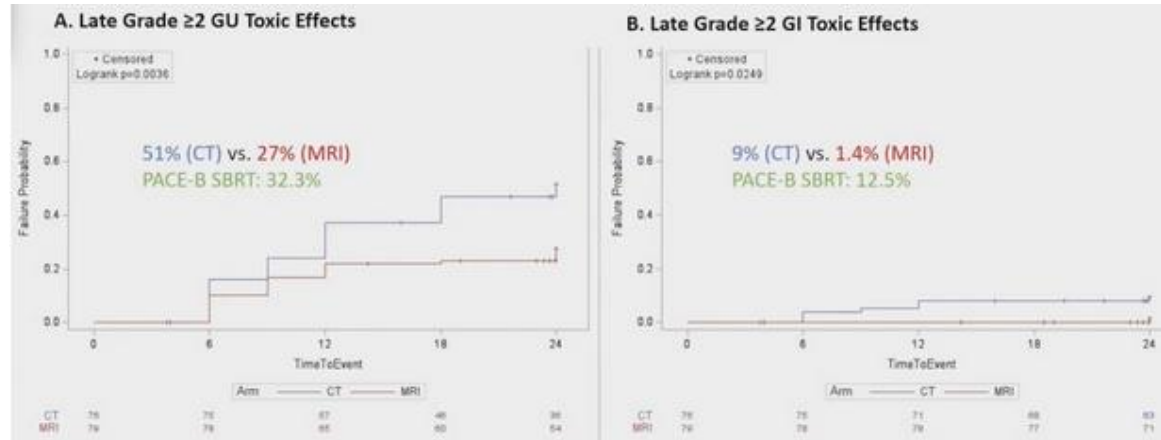

### ASTRO 2024: MRI-Guided versus CT-Guided SBRT for Prostate Cancer: 2-Year Outcomes from the MIRAGE Randomized Clinical Trial

Previously, the MIRAGE trial showed in a randomized trial (156 pts) that margin reduction using MRI guidance has been shown to reduce acute grade 2+ GU and GI following prostate SBRT

PTV Margins of 4 mm (CT-arm) and 2 mm (MRI-arm) were placed around the prostate and proximal seminal vesicles, and this volume received 40 Gy in 5#.

Parameter	CT (n=77)	MRI (n=79)
Age (median, IQR)	71 (67-77)	71 (68-75)
Risk Group		
Imaging NO		
Favorable Intermediate	15 (19%)	14 (18%)
Unfavorable Intermediate	24 (32%)	40 (51%)
High Risk	21 (27%)	15 (19%)
Very High Risk	9 (12%)	5 (6%)
Imaging N+	7 (9%)	5 (6%)
ADT Use	57 (74%)	49 (62%)
Nodal Radiation	19 (25%)	18 (23%)
GTV Boost	22 (29%)	19 (24%)
Rectal Spacer	32 (42%)	37 (47%)
Prior TURP/HOLEP	3 (4%)	5 (6%)
Prostate Size (mL, median, IQR)	41 (33-59)	39 (30-54)
IPSS (median, IQR)	6 (3-11)	7 (4-12.5)

Compared to CBCT -based SBRT, patients receiving MRI-guided SBRT had significantly lower cumulative incidences of grade 2+ GU and GI through two years

## ABRUPT

### CLINICAL INVESTIGATION

## Ablative Radiation Therapy for Unfavorable Prostate Tumors (ABRUPT): Preliminary Analysis of Toxicity and Quality of Life from a Prospective Study

Stefano Arcangeli, MD,<sup>\*,†</sup> Chiara Chissotti, MD,<sup>†</sup> Federica Ferrario, MD,<sup>†</sup> Raffaella Lucchini, MD,<sup>†</sup> Maria Belmonte, MD,<sup>†</sup> Giorgio Purrello, MD,<sup>†</sup> Riccardo Ray Colciago, MD,<sup>†</sup> Elena De Ponti, MSc,<sup>1,†</sup> Valeria Faccenda, MSc,<sup>†</sup> and Denis Panizza, MSc<sup>1,†</sup>

<sup>\*</sup>Radiation Oncology Department, Fondazione IRCCS San Gerardo dei Tintori, Monza, Italy; <sup>†</sup>School of Medicine and Surgery, University of Milan Bicocca, Milan, Italy; and <sup>1</sup>Medical Physics Department, Fondazione IRCCS San Gerardo dei Tintori, Monza, Italy

- Thirty patients enrolled in a single arm prospective trial received 24Gy SDRT to the whole prostate with urethra-sparing and organ motion control delivered on a Linac
- Median follow-up was 18 months (range, 6-31 months), with no  $\geq$ G3 late side effects observed. G2 late GI and G2 late GU toxicities occurred in 1 and 2 patients, respectively

**Table 3** Incidences of acute ( $\leq$ 3 months) and late ( $\geq$ 6 months) genitourinary and gastrointestinal highest-grade treatment-related adverse events according to CTCAE v.5.0

Adverse event	Acute			Late		
	Grade 1 n (%)	Grade 2 n (%)	Grade $\geq$ 3 n (%)	Grade 1 n (%)	Grade 2 n (%)	Grade $\geq$ 3 n (%)

Any*	6 (20.0)	2 (6.7)	–	8 (26.7)	2 (6.7)	–
<b>Gastrointestinal</b>						
Hematochezia	–	–	–	–	–	–
Tenesmus/Proctitis	1 (3.3)	–	–	2 (6.7)	1 (3.3)	–
Fecal Incontinence	–	–	–	–	–	–
Bowel frequency	–	–	–	–	–	–
Any*	1 (3.3)	–	–	2 (6.7)	1 (3.3)	–

Abbreviations: CTCAE = Common Terminology Criteria for Adverse Events.

\* Any genitourinary or gastrointestinal toxic effect indicates the highest-grade adverse event in that domain for all patients. Patients may have experienced more than 1 category of adverse event.

Promising data on the feasibility and safety of 24Gy whole-gland SDRT with urethra-sparing and organ motion control, in association with androgen deprivation therapy and an adequate prophylactic medication, in organ-confined unfavorable PCa

## RCT: GETUG-AFU18

Meeting Abstract: 2024 ASCO Genitourinary Cancers Symposium

FREE ACCESS | Prostate Cancer - Localized | January 29, 2024

### Long-term results of dose escalation (80 vs 70 Gy) combined with long-term androgen deprivation in high-risk prostate cancers: GETUG-AFU 18 randomized trial.

Authors: [Christophe Hennequin](#), [Paul Sargos](#), [Lise Roca](#), [Marion Silva](#), [Igor Latorzeff](#), [Didier Peiffert](#), [Salvatore Cozzi](#), ... [SHOW ALL](#) ... [French Genito-Urinary](#)

[Tumours Study Group \(GETUG\)](#) | [AUTHORS INFO & AFFILIATIONS](#)

Publication: [Journal of Clinical Oncology](#) • [Volume 42, Number 4, suppl](#) • [https://doi.org/10.1200/JCO.2024.42.4\\_suppl.LBA259](https://doi.org/10.1200/JCO.2024.42.4_suppl.LBA259)

505 patients were included between June 2009 and January 2013

Patients were randomly assigned to dose-escalated RT (80 Gy) or conventional-dose (70 Gy) with 3 years of ADT in both arms.

The bcPFS was significantly improved in the dose-escalated RT arm compared with conventional RT arm (HR = 0.56, [95% CI, 0.40-0.76],  $p = 0.0005$ ). The 5-year bcPFS was 91.4% (95% CI, 87.0-94.4) and 88.1% (95% CI, 83.2-91.6), and the 7-year bcPFS 88.1% (95% CI, 83.1-91.7) and 79.2% (95% CI, 73.1-84.0) in dose-escalated RT and conventional RT, respectively.

We did observe significant differences in prostate cancer-specific survival (HR = 0.48 [95% CI, 0.27-0.83],  $p = 0.0090$ ) and overall survival (HR = 0.61 [95% CI, 0.44-0.85],  $p = 0.0039$ )

#### Conclusions:

Dose-escalation RT in combination with long-term ADT is effective and safe, increasing bcPFS rate but also specific survival and overall survival in high-risk prostate cancer patients without increasing long-term toxicity. [Clinical trial information: NCT00967863](#).

## RCT: PEACE V -STORM

Results: biochemical relapse-free survival

3 year bRFS:

- MDT = 47% (41%, 55%)
- ENRT = 69% (63%, 76%)

Results: locoregional relapse-free survival

3 year rRFS:

- MDT = 70% (63%, 77%)
- ENRT = 90% (85%, 94%)

Locoregional relapse-free survival was similarly improved, from 70% to 90% (p=0.002).

- ✓ After SBRT, 25% had pelvic nodal relapse compared with 3% in the ENRT arm.
- ✓ Omission of prostate bed radiotherapy trebled the chance of a prostate bed recurrence (14% vs. 5%).
- ✓ On the basis of the data presented, ENRT should be considered optimal care for men who wish to maximise their biochemical and relapse-free survival outcomes.

## RCT: PARTIQOL

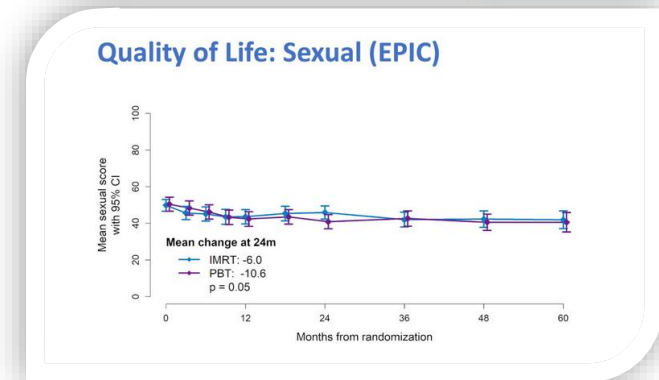

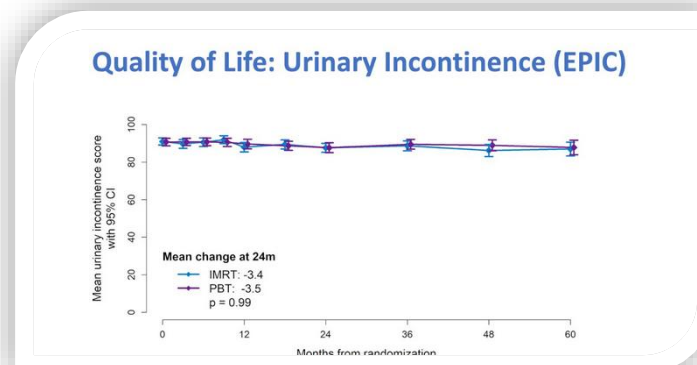

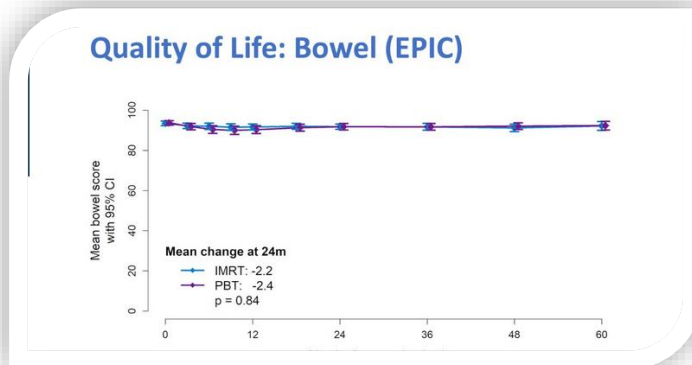

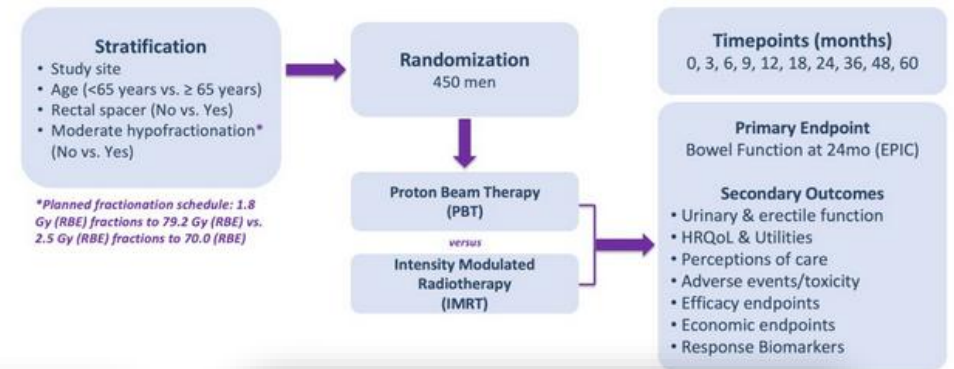

ASTRO 2024: Prostate Advanced Radiation Technologies Investigating Quality of Life (PARTIQoL): Phase III Randomized Clinical Trial of Proton Therapy vs IMRT for Localized Prostate Cancer

### Study Design & Aims: Phase III RCT

ARTIQoL trial (NCT01617161) is a multi-center phase 3 randomized study compared the two radiation therapy modalities (PBT vs. IMRT) in low-intermediate PC.

450 men: 221 PBT vs 215 IMRT

Analysis @24months

Patients treated with RT for localized prostate cancer achieve excellent HRQoL alongside highly effective tumor control.

No significant differences were observed in HRQoL endpoints or cancer control outcomes between the two modalities.

The investigators continue to monitor participants for longer-term follow-up and secondary endpoints.

## AGENDA

- 1. News in radical approach for prostate cancer patients*
- 2. News in post-radical setting for prostate cancer patients*

## RCT: RADICALS-HD

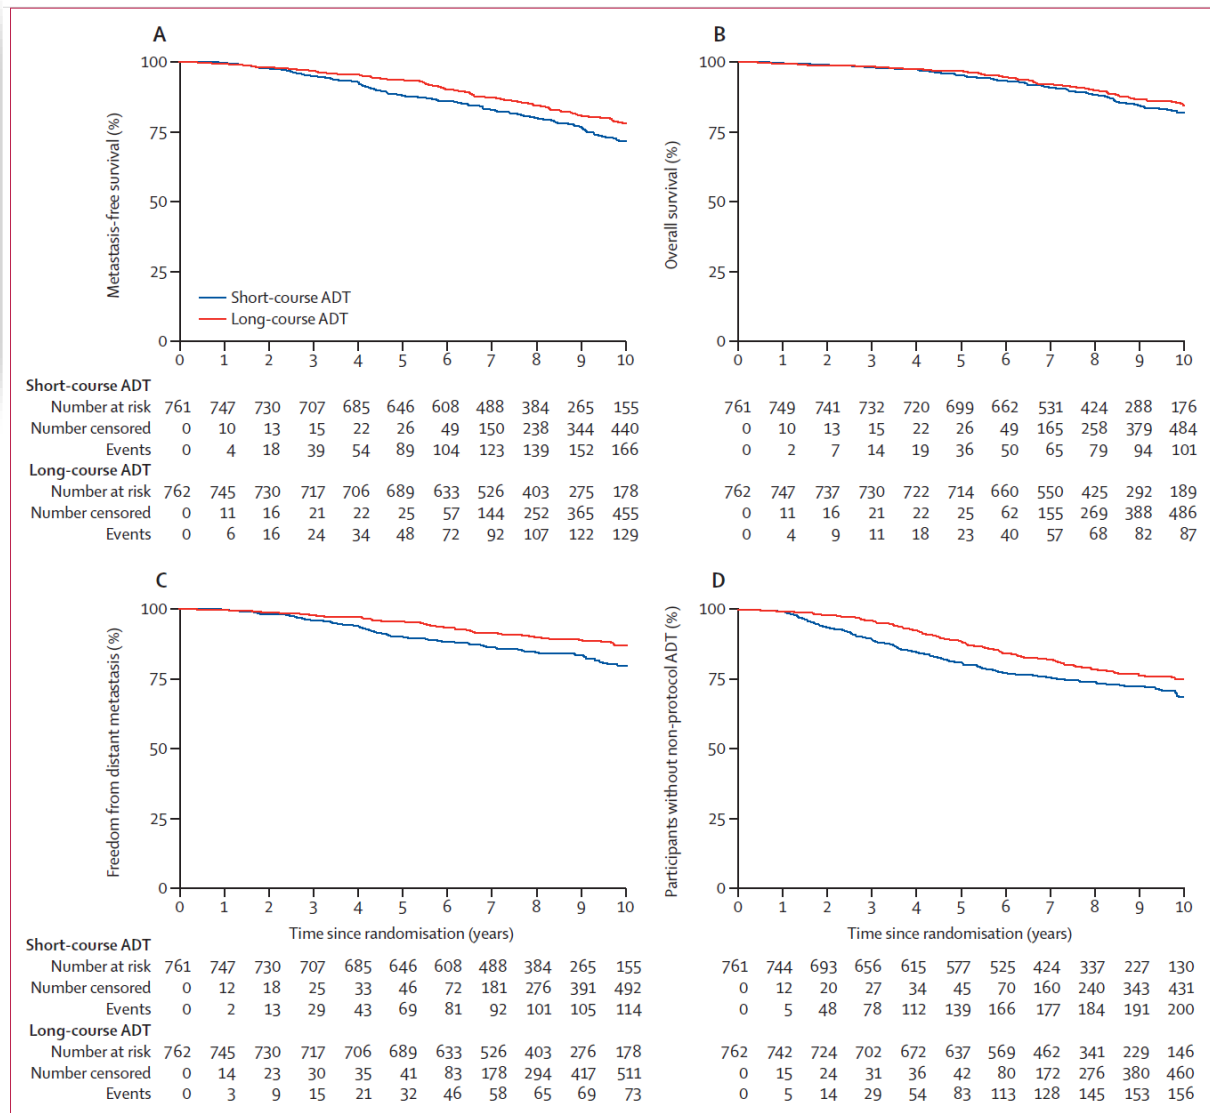

### Duration of androgen deprivation therapy with postoperative radiotherapy for prostate cancer: a comparison of long-course versus short-course androgen deprivation therapy in the RADICALS-HD randomised trial

Chris C Parker, Howard Kynaston, Adrian D Cook, Noel W Clarke, Charles N Catton, William R Cross, Peter M Petersen, Rajendra A Persad, Cheryl A Pugh, Fred Saad, John Logue, Heather Payne, Lorna C Bower, Chris Brawley, Mary Rauchenberger, Maroie Barkati, David M Bottomley, Klaus Brasso, Hans T Chung, Peter W M Chung, Ruth Conroy, Alison Falconer, Vicky Ford, Chee L Goh, Catherine M Heath, Nicholas D James, Charmaine Kim-Sing, Ravi Kodavatiganti, Shawn C Malone, Stephen L Morris, Abdenour Nabid, Aldrich D Ong, Rakesh Raman, Sree Rodda, Paula Wells, Jane Worthing, Wendy R Parulekar\*, Mahesh K B Parmar\*, Matthew R Sydes\*, on behalf of the RADICALS investigators†

- Randomised controlled trial of ADT duration (short 6 ms vs long 24 ms course) within the RADICALS protocol.
- 1523 patients at 138 centres, median follow-up of 8,9 years
- 10-year metastasis-free survival was 71.9% (95% CI 67.6-75.7) in the short-course ADT group and 78.1% (74.2-81.5) in the long-course ADT group.

- ✓ Compared with adding 6 months of ADT, adding 24 months of ADT improved metastasis-free survival in people receiving postoperative RT.
- ✓ For individuals who can accept the additional duration of adverse effects, long-course ADT should be offered with postoperative radiotherapy.

- Fifty patients enrolled in a single arm prospective trial received with PSA levels between 0.1-2.0 ng/mL after radical prostatectomy received Linac-based SBRT to the prostate bed in five fractions every other day for a total dose of 32.5 Gy (EQD21.5 = 74.3 Gy)
- Median follow-up was 12 months(range,3-27months), with no ≥G2 late side effects observed.
- Late G1 urinary and rectal toxicities occurred in 46 % and 4 % of patients, respectively

Our findings show that post-prostatectomy SBRT did not result in increased toxicity nor a significant decline in QoL measures, thus showing that it can be safely extended to the postoperative setting.

### Maximum late toxicity after RT.

	Grade 1	Grade 2	Grade ≥ 3
<b>Late GU toxicity</b>	<b>N (%)</b>	<b>N (%)</b>	<b>N (%)</b>
