Trattamento della malattia oligometastatica ed oligoprogressiva: stato dell' arte e prospettici in termini di studi clinici – Tumori del colon-retto e tratto gastroenterico

Pierfrancesco Franco MD, PhD Dipartimento di Medicina Traslazionale, Università del Piemonte Orientale, Novara Dipartimento di Radioterapia Oncologica, AOU 'Maggiore della Carità', Novara

VIRTUAL

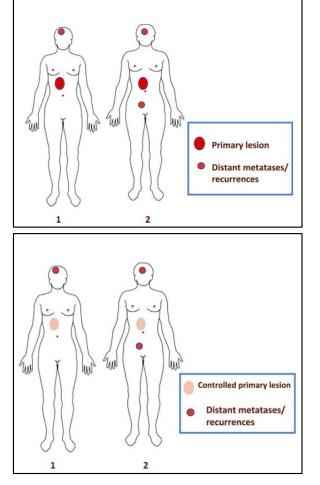

26 MARZO 2021

# Colorectal cancer

- $\checkmark~$  Up to 20% of pts have metastatic CRC at presentation
  - ✓ Metastatic rate: 60-70% liver; 25-40% lung; 5-10% bone; 3-5% ovary; 1% adrenal gland; 1% CNS
  - $\checkmark$  50% have disease limited to the liver at the time of death
  - ✓ 20% liver-only disease
- ✓ An additional 25-50% will develop metastasis after initial early or locally advanced stage disease
- Median overall survival: up to 36 months (from 16 months in 10 years) but within clinical trials
- ✓ Long-term survivors: around 14% at 5 years (population-based data from NCI)

VIRTUAL 26 MARZO 2021

## DE NOVO metastatic CRC- Around 20%

Recurrence after previously treated localized disease - around 40% Metastatic rate

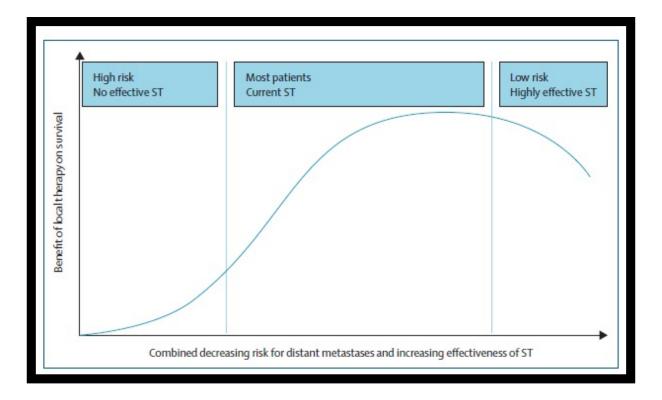

- Stage I (T1/T2N0) around 10%
- Stage II (T3/T4N0) 10-20%
- Stage III (Any T/N+) 25-50%

R0 surgical resection + adjuvant CT reduces risk of relapse to 20-30%

VIRTUAL 26 MARZO 2021

Intrinsic biology and systemic therapy effectiveness drives local control effect on survival

Poortmans et al; Lancet 2014

## Molecular tumor profiling in CRC

- ✓ Pathologic testing of tumor tissue to assess:
  - ✓ Sequential variants in NRAS, KRAS, BRAF
  - ✓ MSI-H and MMR-D
  - ✓ c-erb-B2 amplification

✓ Valuable for all pts with metastastic CRC willing to receive systemic treatment

- ✓ Molecular profiling can be performed on primary tumor specimen
- ✓ If tissue unavailable: re-biopsy

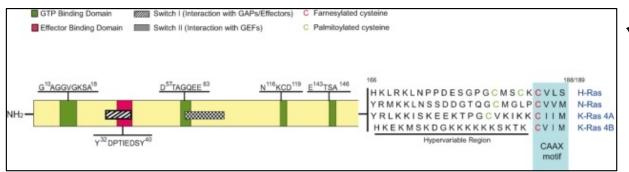

VIRTUAL 26 MARZO 2021

Survival depends on the molecular subtype which informs prognosis:

- ✓ Identifying tumor's natural history
- ✓ Selecting the most suitable therapeutic approach

## **RAS protein**

Nitsche U et al, Dig Surg 2016; Modest DP et al, Ann Oncol 2016; Biller LH et al, JAMA 2021

 ✓ KRAS/NRAS/BRAF wt (50%): median survival 30 months (with therapy); OS: 80% (1-yr); 40% (3yr); 20% (5-yr) from start I line CT

- ✓ Median survival: 19 months Rsided (î KRAS and BRAF sequence variations,î MSI-H) vs 34 months L-sided CRC
- ✓ Pooled analysis 5 RCT: median OS CRC with KRAS sequence variations: 21 months and 11.7 months for those with BRAF sequence variations

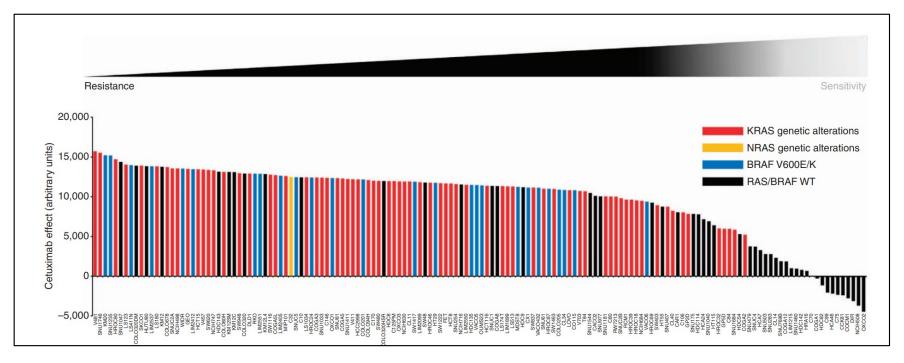

VIRTUAL 26 MARZO 2021

## Resistance to anti-EGFR drugs

#### Cetuximab screening on CRC cell lines

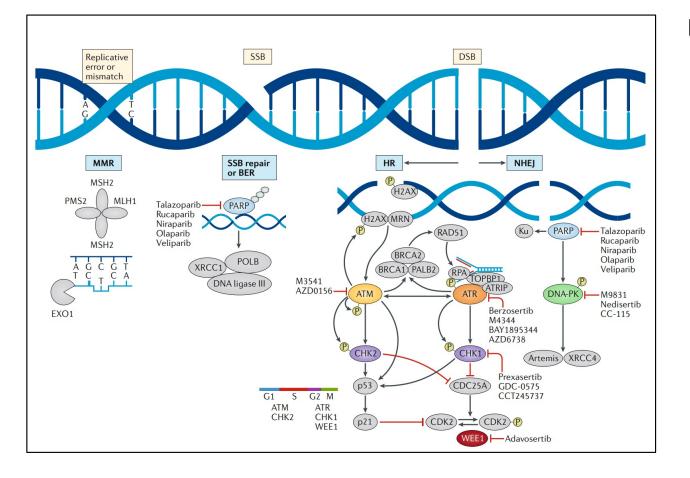

The indicated cell lines were treated with increasing concentrations of cetuximab for 4 days and the cell viability was assessed by measuring ATP content. Bars represent an arbitrary index of cetuximab effect on each cell line as detailed in the methods. Cell lines sensitive to cetuximab are shown with a negative index. Red bars represent KRAS altered lines; yellow bars indicate NRAS-mutated cells; blue bars indicate genetic alterations affecting codon V600 of BRAF; black bars indicate RAS/BRAF wild-type cells. NCIH630 cells are KRAS amplified46

Medico E et al, Nat Commun 2015

VIRTUAL 26 MARZO 2021

#### BIOLOGIA E TRATTAMENTO RADIANTE CURATIVO DELLA MALATTIA OLIGOMETASTATICA

### DNA damage response pathway

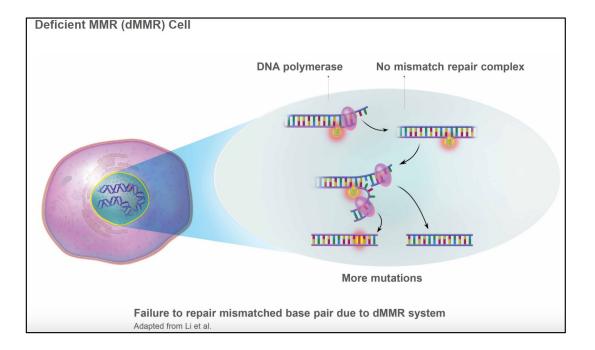

Errors in base-pair matching during DNA replication are repaired by the MMR system

Yap et al; Nat Rev Cancer 2018

#### BIOLOGIA E TRATTAMENTO RADIANTE CURATIVO DELLA MALATTIA OLIGOMETASTATICA

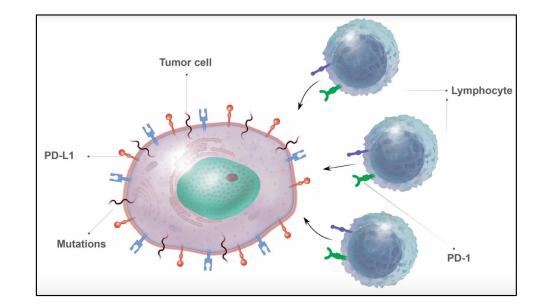

- ✓ MMR-D: mismatch repair deficiency (via IHC)
- ✓ MSI-H: microsatellite instability-high (via PCR)
- Faulty mismatch repair process: accumulation of insertions/deletions at sites of repetitive DNA units called MICROSATELLITES. This situation is called Microsatellite instability
- Tumors having MSI due to MMR-D can exhibit MSI-high (MSI-H) phenotype

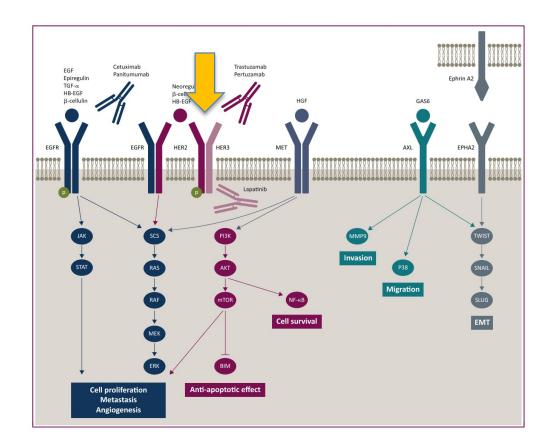

#### BIOLOGIA E TRATTAMENTO RADIANTE CURATIVO DELLA MALATTIA OLIGOMETASTATICA

- Tumors with MMR-D/MSI-H harbors thousands mutations which are a trigger for the immune system
- ✓ MSI-H tumors contain high levels of lymphocyte infiltrates and strong expression of immune checkpoints, including PD-1 and PD-L1
- ✓ In colorectal MSI-H cancers, the dominant source of PD-L1 may be macrophages or other tumor-infiltrating lymphocytes and myeloid cells, rather than tumor cells

#### BIOLOGIA E TRATTAMENTO RADIANTE CURATIVO DELLA MALATTIA OLIGOMETASTATICA

## c-erbB2/HER2

- Human epidermal growth factor receptor 2 (*HER2*) is an oncogenic driver
- A subset (approximately 5%) of metastatic colorectal cancer (CRC) tumors is driven by amplification or mutation of *HER2*.
- HER2 is a clinically actionable target in CRC, with relevance as a therapeutic target
- Substantial clinical benefit in patients treated with biomarker-driven HER2-targeted therapies, with an impact on response rates and duration of response
- HER2-targeted therapeutic strategies have the potential to change the treatment paradigm for a clinically relevant subgroup of metastatic CRC patients.

Martinelli et al; Ann Oncol 2020 Siena et al; Ann Oncol 2018

## FDA-approved drugs for the treatment of metastatic CRC

Drug name	FDA-approval	Mechanism of action	Typical use	Common AE (% Grades 1-4)	SeverAE (% Grades 3-4)
Leucovorin	1952	Folic acid analog; interrupts DNA synthesis	Combined with 5-FU	Not reported	Not reported
5-FU	1962	Pyrimidine analog; interrupts DNA synthesis	Combined with Leucovorin	Anemia (79), diarrhea (61), mucositis (62), nausea (51), neutropenia (46)	Coronary vasospasm (<8), diarrhea (10), mucositis (14), neutropenia (8)
CPT-11	1996	Topoisomerase I inhibitor; intrrupts the breaking and rejoining of DNA strands during replication	As single agent or in combination	Anemia (97), alopecia (60), diarrhea (83), nausea (82), neutropenia (96)	Anemia (7), diarrhea (31), nausea (16), neutropenia (31)
Capecitabine	1998	Pyrimidine analog; interupts DN synthesis	As single agent or in combination	Anemia (80), diarrhea (55), H/F syndrome (54), nausea (43), neutropenia (13)	Coronary vasospasm (<8), diarrhea (10), mucositis (14), neutropenia (8), H/F syndrome (17)
Oxaliplatin	2002	Alkylating agent; causes DNA breaks	Only in combination	Anemia (64), diarrhea (46), nausea (64), peripheral neuropathy (76), thrombocytopenia (30)	Hypersensitivity reaction (<1), neuropathy (7), neutropenia (<10)
Cetuximab	2004	Recombinant chimeric monoclonal antibody to EGFR; stops cell growth	Used only for KRAS/NRAS wild- type tumors	Acneiform rash (90), constipation (54), diarrhea (42), headache (38), hypomagnesemia (55), nausea (64)	Hypersensitivity reaction (2), hypomagnesemia (6-17), rash (16)
Bevacizumab	2004	Humanized monoclonal antibody VEGF; interrupts growth of blood vessels	Combined with 5-FU/Leucovorin, oxaliplatin, CPT-11	Delayed wound healing (4), diarrhea (21), hypertension (34)	GI perforation (2), hemorrhage (4), hypertension (5), proteinuria (1), thromboses (5)

#### Biller LH et al, JAMA 2021

#### FDA-approved drugs for the treatment of metastatic CRC

Drug name	FDA-approval	Mechanism of action	Typical use	Common AE (% Grades 1-4)	SeverAE (% Grades 3-4)
Panitumumab	2006	Humanized monoclonal Ab to EGFR; interrupts cell growth	Use only for KRAS/NRAS wild-type tumors	Diarrhea (21), hypomgnesemia (38), nausea (23), skin toxicity (90), acneiform (57)	Hypersensitivity reaction (1), hypomagnesemia (2), skin toxicity (16)
Regorafenib	2012	Multikinase inhibitors; interrupts cell and blood vessels growth	Used as single agent	Diarrhea (43), H/F syndrome (53), hemorrage (18), hypophosphathemia (57), hypertension (30), pain (59)	Cardiac ischemia (1), H/F syndrome (17), hemorrage (3), hepatotoxicity (0.3)
Ziv-aflibercet	2012	Recombinant fusion protein that function as a decoy receptor to bind VEGF-A and B and placental growth factor; interrupts blood vessels growth	In combination with FOLFIRI	Diarrhea (69), hypertension (41), proteinuria (62)	Diarrhea (19), gastrointestinal perforation (0.8), hemorrage (3), proteinuria (8)
Ramucirumab	2015	Recombinant humanized monolonal antibody to VEGF-R2; interrupts growth of blood vessels	In combination with FOLFIRI	Diarrhea (14), hypertension (16), proteinuria (15)	Arterial thromboses (2), gastrointestinal perforation (0.7), hemorrage (4), hypertentsion (8)
Pembrolizumab	2017, 2020	Humanized monoclonal Ab against PD-1 receptor; activates T-cell-mediated immune response	Used only for MSI-H/MMR-D tumors; approved in the first or subsequent line of therapy	Arthralgia (16), nausea (16), diarrhea (13), pruritus (13), hypothyroidism (10)	Colitis (2), hepatitis (2), pancreatitis (3), pneumonitis (2)
Nivolumab	2017	Humanized monoclonal Ab against PD-1 receptor; activates T-cell-mediated immune response	Used only for MSI-H/MMR-D tumors	Diarrhea (21), hypothyroidism (10), pruritus (14), rash (13)	Colitis (1), hepatitis (1), pancreatitis (8)
Ipilimumab	2018	Humanized monoclonal Ab against CTLA-4 receptor; activates T-cell-mediated immune response	Used only for MSI-H/MMR-D tumors in combination with nivolumab	Diarrhea (32), pruritus (31), rash (29)	Pneumonitis (<1), colitis (7), hepatitis (4)
Encorafenib	2020	BRAF inhibitor; interrupts cell growth	Used only for BRAF V600E-variant tumors in combination with cetuximab	Anemia (34), arthralgia (26), nausea (34), rash (26)	Anemia (4), cutaneous malignancies (1), hemorrage (2)

VIRTUAL 26 MARZO 2021

Oxaliplatin- containing regimens	Dosing schedule	First-line use	Dose limiting toxicity/AE	Comments
FOLFOX	Every 2 weeks; half day infusion in the clinic; 5-FU as continuous infusion via pump for 2 days as outpatient	Yes	Pancytopenia, neuropathy, hypersensitivity	Most common adjuvant regimen
САРОХ	Every 3 weeks with infusion in clinic and oral capecitabine for 2 weeks, 1 week off	Yes	Pancytopenia, diarrhea, H/F syndrome, neuropathy, hypersensitivity	Common adjuvant regimen; subsitutes oral capecitabine for intravenous 5-FU
FOLFOXIRI	Every 2 weeks; half day infusion in the clinic; 5-FU as continuous infusion via pump for 2 days as outpatient	Yes	Pancytopenia, diarrhea, neuropathy, hypersensitivity	Intensive regimes used for fit pts, potentially operable on or with limited metastatic disease or both
FOLFOX + cetuximab or panitumumab	Every 2 weeks; half day infusion in the clinic; 5-FU as continuous infusion via pump for 2 days as outpatient	Yes	Pancytopenia, diarrhea, H/F syndrome, hypomagnesemia, hypersensitivity reactions, neuropathy, skin toxicity	For tumors with KRAS/NRAS/BRAF wilde type; ineffective for tumors with sequence variations in these genes

Irinotecan-containing regimens	Dosing schedule	First-line use	Dose limiting toxicity/AE	Comments
Irinotecan	Frequency depending on dosing schema	No	Diarrhea	Severe diarrhea and neutropenia may occur in pts with UGT1A (NCBI 7361) polymoprphism
FOLFIRI	Every 2 weeks; half day infusion in the clinic; 5-FU as continuous infusion via pump for 2 days as outpatient	Yes	Pancytopenia, diarrhea	Not used in adjuvant regimens; dosing schedule as FOLFOX
CAPIRI	Every 3 weeks with infusion in clinic and oral capecitabine for 2 weeks, 1 week off	Yes	Pancytopenia, diarrhea, H/F syndrome	Substitutes oral capecitabine for iv 5-FU
Irinotecan + cetuximab or panitumumab	Either weekly of every 2 weeks by infusion	No	Diarrhea, hypomagnesemia, infusion reactions, skin toxicity	KRAS/NRAS/BRAF wild type
FOLFIRI + cetuximab or panitumumab	Every 2 weeks; half day infusion in the clinic; 5-FU as continuous infusion via pump for 2 days as outpatient	Yes	Pancytopenia, diarrhea, hypomagnesemia, infusion reaction, skin toxicity	KRAS/NRAS/BRAF wild type

VIRTUAL 26 MARZO 2021

Biller LH et al, JAMA 2021

Dose limiting toxicity/AE Fluorouracil-containing Dosing schedule First-line use Comments regimens Fluorouracil and Bolus and continous infusion regimens Pancytopenia, mucositis Single-agent regimen; often optimal for frail pts Yes leucovorin with major comorbidities Capecitabine Oral regimen given for 3 of every 4 Yes Pancytopenia, H/F syndrome May be preferred if no plans to intensify treatment weeks

VEGF-containing regimens	Dosing schedule	First-line use	Dose limiting toxicity/AE	Comments
Bevacizumab + FOLFOX, CAPOX, FOLFIRI, CAPIRI, FOLFOXIRI, 5-FU and leucovorin, or capecitabine	Infusion time depends on specific CT given	Yes	Hypertension, bowel perforation, poor wound healing, proteinuria, thrombosis	All molecular subtypes
FOLFIRI + Ramicirumab	Every 2 weeks; half day infusion in the clinic; 5-FU as continuous infusion via pump for 2 days as outpatient	No	Pancytopenia, diarrhea, hypertension, poor wound healing, proteinuria	All molecular subtypes
FOLFIRI + zif-aflibercept	Every 2 weeks; half day infusion in the clinic; 5-FU as continuous infusion via pump for 2 days as outpatient	No	Pancytopenia, diarrhea	All molecular subtypes

	EGFR Ab monotherapy	Dosing schedule First-line use		Dose limiting toxicity/AE	Comments	
	Cetuximab	Either weekly or every 2 weeks by infusion	No	Infusion reaction, hypomagnesemia, skin toxicity	KRAS/NRAS wild type	
Biller LH et al, JAMA 2021	Panitumumab	Every 2 weeks by infusion	No	Infusion reaction, hypomagnesemia, skin toxicity	KRAS/NRAS wild type	

VIRTUAL 26 MARZO 2021

Immunotherapy regimens for metastastic CRC with MSI-H/MMR-D	Dosing schedule	First-line use	Dose limiting toxicity/AE	Comments
Pembrolizumab	Every 3 or 6 weeks by infusion	Yes	Fatigue, colitis, dermatitis, hepatitis, pneumonitis, thyroiditis	MSI-H/MMR-D only
Nivolumab	Every 2 by infusion	No	Fatigue, colitis, dermatitis, hepatitis, pneumonitis, thyroiditis	MSI-H/MMR-D only
Nivolumab + ipilumumab	Every 2 by infusion	No	Fatigue, colitis, dermatitis, hepatitis, pneumonitis, thyroiditis	MSI-H/MMR-D only

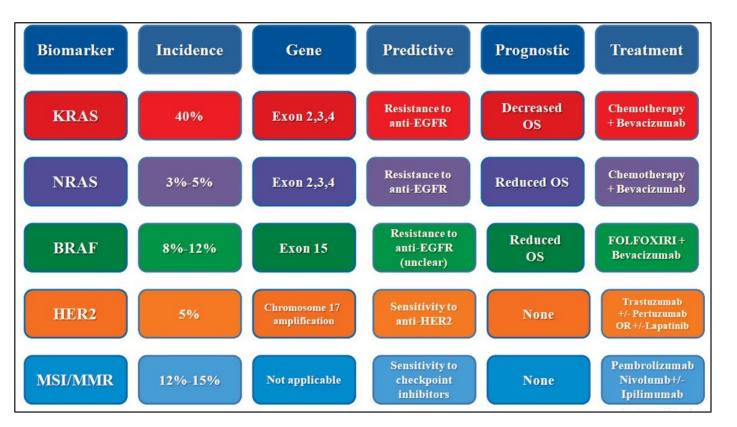

Combination regimens for metastastic CRC expressing BRAF V600E sequence variation + RAS wt	Dosing schedule	First-line use Dose limiting toxicity/AE		Comments		
Encorafenib + Cetuximab	Either weekly or every 2 weeks No Diarrhea, pancytopenia, skin infusion with continuous oral toxicity regimen		BRAF V600E variant			
	Other regimens for refractory metastastic	Dosing sc	hedule	First-line use	Dose limiting toxicity/AE	

Comments CRC Regorafenib Oral regimen given for 3 ot 4 No H/F syndrome, All molecular subtype hypophosphatemia, weeks hepatotoxicity Trastuzumab + Every 3 weeks or weekly infusion Diarrhea, hypokalemia, ERBB2 amplified No pertuzumab or with continuous oral regimen cardiotoxicity palatinib or tucatinib

What about metastasis-directed therapy in CRC oligometastatic patients?

Anselmo Bucci, Fuoco! 1918, collezione Mazzei Buizza

# The Oligometastatic State

•Patients with few (1-5) metastases may be at a continuum between truly local disease and widely disseminated cancer

•In such a state of limited disease burden, the eradication of all sites of metastatic disease could result in long-term survival or even cure in a subgroup of pts

•This hypothesis is based on long-term survival following surgical resection of limited lung and liver metastases in some tumors (especially CRC)

#### VIRTUAL 26 MARZO 2021

#### ESTRO-EORTC consensus recommendation for the characterisation and classification of oligometastastic disease

	Review
Characterisation and classification of oligometastatic	* <b>(</b>
disease: a European Society for Radiotherapy and Oncology and European Organisation for Research and Treatment of Cancer consensus recommendation	

- ✓ Q1: Does the pt have a history of polymetastatic disease before current diagnosis of oligometastatic disease?
- ✓ Q2: Does the pt have a history of oligometastatic disease before current diagnosis of oligometastatic disease?
- ✓ Q3: Has oligometastastic disease been first diagnosed more than 6 months after the primary cancer diagnosis?
- ✓ Q4: Is the patient under active systemic therapy at the time of oligometastatic disease diagnosis?
- ✓ Are any oligometastatic lesions progressive on current imaging?

Guckenberger M et al; Lancet Oncol 2020

#### VIRTUAL 26 MARZO 2021

#### ESTRO-EORTC consensus recommendation for the characterisation and classification of oligometastastic disease

A De-novo oligometastatic disease

• T0: first time diagnosis of primary cancer (green) and oligometastases (red) within 6 months

#### Metachronous oligorecurrence

- T-X: diagnosis and treatment of primary cancer (green) in a non-metastatic state
- Systemic therapy-free interval
- T0: First time diagnosis of new oligometastases (red) >6 months after diagnosis of cancer

#### Metachronous oligoprogression

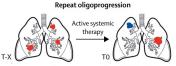

- T-X: diagnosis and treatment of primary cancer (green) in a non-metastatic state
- Under treatment with active systemic therapy
  T0: first time diagnosis of new oligometastases (red) >6 months
- after diagnosis of cancer

Repeat oligorecurrence

B Repeat oligometastatic disease

 T-X: diagnosis of oligometastases followed by local treatment or systemic treatment or both
 Systemic therapy-free interval
 TO: diagnosis of new (blue) and growing or regrowing (red) oligometastases

T-X: diagnosis of oligometastases followed by local treatment or systemic treatment or both
Under treatment with active systemic therapy
TO: diagnosis of new (blue) and growing or regrowing (red) oligometastases

#### Repeat oligopersistence

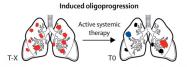

- T-X: diagnosis of oligometastases followed by local treatment or systemic treatment or both
  Under treatment with active systemic therapy
- T0: diagnosis of persistent non-progressive (red) oligometastases

 T-X: diagnosis of polymetastatic metastatic disease followed by systemic treatment with or without local treatment - Systemic therapy-free interval - TD: diagnosis of new (blue) and growing or regrowing (red)

 OC diagnosis of new (blue) and growing or regrowing (red) oligometastases, possible residual non-progressive metastases (black)

T-X: diagnosis of polymetastatic metastatic disease followed by systemic treatment with or without local treatment
Under treatment with active systemic therapy
T0: diagnosis of new (blue) and growing or regrowing (red) oligometastases, possible residual non-progressive metastases (black)

T-X: diagnosis of polymetastatic metastatic disease followed by systemic treatment with or without local treatment
Under treatment with active systemic therapy
T0: diagnosis of persistent non-progressive oligometastases (red), where response is worse compared with other residual metastases (black)

# Esophageal cancer

#### Buas et al; Semin Radiat Oncol 2013

# SCC- ESO-Shanghai 2 trial: a prospective phase II trial

## **Inclusion criteria**

- ✓ Histologically proven ESCC
- Primary tumor treated definitively with no progression within 3 months from accrual
- ✓ ≤ 3 metastatic lesions on any distribution in ≤ 2 anatomic sites, with ≤ 5 cm diameter
- ✓ All mets amenable to SBRT
- ✓ Age ≥ 18; ECOG PS ≤ 2
- ✓ All mets naive of local therapies (surgery, RT, RF)

## **Exclusion criteria**

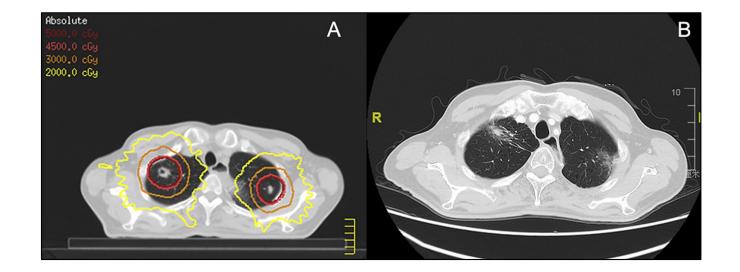

- Progressive primary tumor
- ✓ Brain mets
- ✓ Metastatic disease invading GI tract
- ✓ Systemic therapy at diagnosis of oligometatastasis

# Oligometastastic disease

- Synchronous oligometastasis: oligomets diagnosed between 3 and 6 months of definitve treatment of primary tumor
- Metachronous oligorecurrence: no history of metastastic disease who received a diagnosis > 6 months after diagnosis of primary tumor
- Repeat oligorecurrence: prior history of metastastic disease before current diagnosis

Liu et al, IJROBP 2020

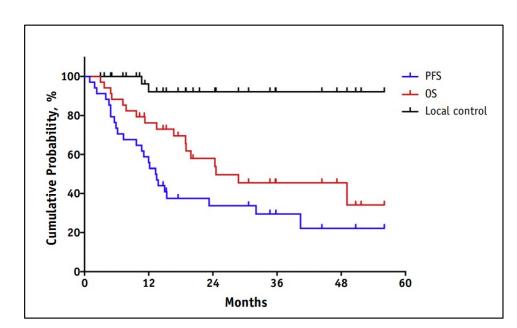

- ✓ Most common schedule: 48 Gy/6 fractions (24 targets)
- ✓ BED<sub>tumor</sub> < 80 Gy in 4 pts to respect normal tissue dose constraints

Liu et al, IJROBP 2020

Location	Description	Recommended dose
Lung (central)	>1cm from CW and > 2 cm from the mediastinum, pericardium and brachial plexus	50Gy/5fractions
Lung (peripheral)	Abutting CW o $\leq$ 1 cm or within 2 cm of mediastinum or brachial plexus	48Gy/6fractions
Liver		48Gy/6fractions
Adrenal gland		48Gy/6fractions
Abdominal lymphnode		48Gy/6fractions
Bone/vertebral body	Any bone except femur	30 Gy/3fractions

Primary endpoint: PFS; secondary endpoints: OS, LC, toxicity, adverse events, QoL (EORTC QLQC30 + QLQ-OES18)

Liu et al, Future Oncol 2021

## VIRTUAL 26 MARZO 2021

# ESO-Shanghai 13 eligibility criteria

- ✓ Mts definition:
  - Distant organ mts
  - Nonregional lymphnodes
  - Distant organ/nonregional nodes + regional nodes
  - ✓ Excluded: regional mets only or anastomotic recurrence
- ✓ Oligometastastic disease:
  - ✓ Synchronous oligometastasis
  - ✓ Metachronous oligometastasis
  - ✓ Repeat oligometastasis
    - ✓ New oligometastasis in a pt with a previous metastastic diagnosis
    - Previous lesion regrowth after diagnosis of oligomeatstasis followed by treatment and systemic therapy free interval

- ✓ Primary tumor controlled
- ✓ All mets amenable to local therapy
- ✓ Total number of mets  $\leq 4$
- ✓ Number of mets per single organ  $\leq$  3
- ✓ Maximum diameter ≤ 5 cm
- ✓ If regional recurrence: all adjacent regional nodes are counted together as one lesion
- Nonregional nodes: adjacent metastastic lymphnodes can be treated as one lesion
- Synchronous oligometastasis: controlled primary + regional nodes are counted toward the number of 4
- ✓ Prior chemotherapy > 3 months
- ✓ Measurable lesion determined based on RECIST 1.1 assessment

## VIRTUAL 26 MARZO 2021

# Adenocarcinoma

- 6 studies involving 420 pts
- Metastasectomy for oligomets esophageal cancer
- Adenocarcinoma: 73.5%; SCC: 22.7%
- Synchronous oligomets 73.5% underwent resection of primary tumor + mets
- Preo-op RT-CT: 66.7/; pre-op CT: 33.3%

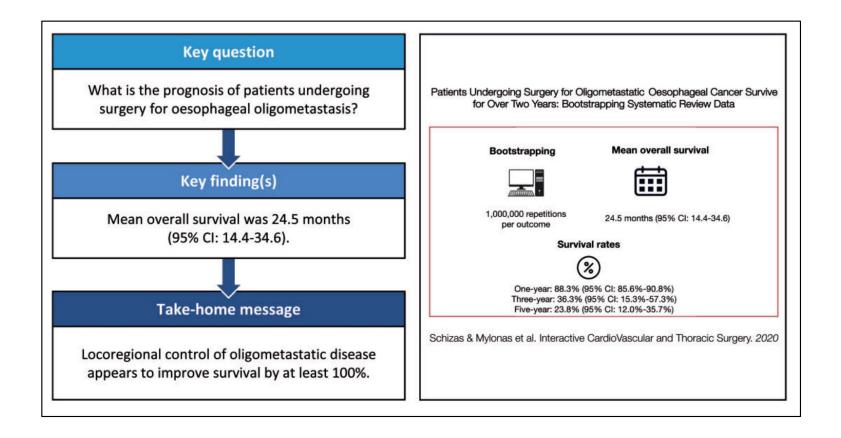

Parameter	Relative rate (%)	95%CI
Т0-Т2	21.5	2.3-16.9
T3-T4	78.5	32.4- 50.6
NO	13.6	10.0- 18.2
N1	86.4	6.3-62.2
M1	100	NA

Metastastic site	Relative rate (%)	95%CI
Peritoneal	37.7	32.5-43.3
Multiple	20.5	16.3-2.5
Liver	16.8	13.1-21.5
Lung	6.2	4.0-9.7
Other	18.5	14.6-23.3

VIRTUAL 26 MARZO 2021

# Conclusion SBRT: evidence accumulated so far

- ✓ High local control rate from retrospective and prospective series
- $\checkmark$  Very low toxicity
- ✓ High feasibility
- PFS advantage confirmed in the first randomized trials across different settings
- Ideal candidate for the combination with targeted agents and immunotherapy?

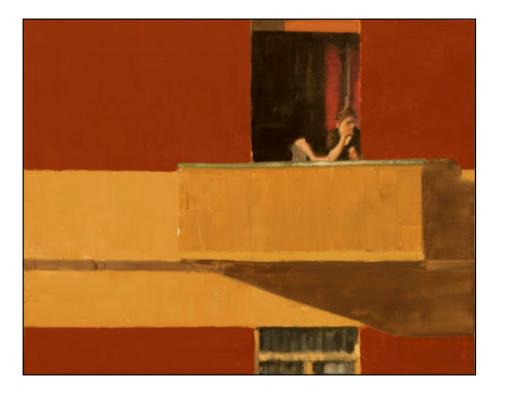

Conclusion Future perspective

- Improvements in diagnostics
- Improvements in SBRT technology
- Deeper knowledge in prognostic factors
- Advances in radiobiological knowledge on SBRT effects (and combination with systemic therapies)
