Il Bias

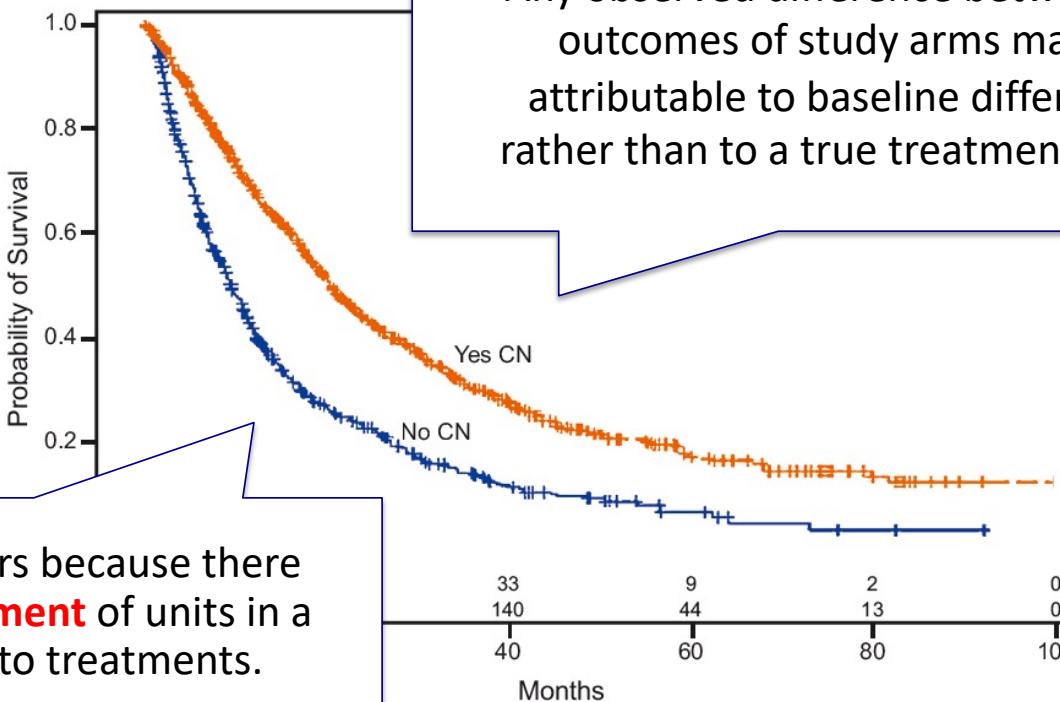

Distorsione dell'effetto di un intervento diagnostico-terapeutico per effetto di una componente estranea al caso:

- selezione dei soggetti da assegnare a uno specifico trattamento, rimozione di alcuni pazienti dall'analisi, analisi non preordinata su sottogruppi di pazienti (***selection bias***)
rimedio: randomizzazione (e stratificazione)
- perdita di pazienti alla valutazione (attrition bias)
rimedio: mascheramento
- conoscenza da parte del paziente/medico/valutatore del trattamento in atto (***performance/detection bias***)
rimedio: mascheramento
- selezione dei risultati da comunicare a mezzo presentazione/pubblicazione (***reporting bias***)

Cytoreductive Nephrectomy in Patients with Synchronous Metastases from Renal Cell Carcinoma: Results from the International Metastatic Renal Cell Carcinoma Database Consortium

Daniel Y.C. Heng ^{a,*†}, J. Connor Wells ^{a,†}, Brian I. Rini ^b, Benoit Beuselinck ^c, Jae-Lyun Lee ^d, Jennifer J. Knox ^e, Georg A. Bjarnason ^f, Sumanta Kumar Pal ^g, Christian K. Kollmannsberger ^h, Takeshi Yuasa ⁱ, Sandy Srinivas ^j, Frede Donskov ^k, Aristotelis Bamias ^l, Lori A. Wood ^m, D. Scott Ernst ⁿ, Neeraj Agarwal ^o, Ulka N. Vaishampayan ^p, Sun Young Rha ^q, Jenny J. Kim ^r, Toni K. Choueiri ^s

EUROPEAN UROLOGY 66 (2014) 7

Any observed difference between the outcomes of study arms may be attributable to baseline differences rather than to a true treatment effect.

A possible **bias** occurs because there is **no random assignment** of units in a target population to treatments.

Reconciling the Use of Cytoreductive Nephrectomy in the Targeted Therapy Era

*Stephen H. Culp **

EUROPEAN UROLOGY 66 (2014) 711–712

Although retrospective, the results of this study are strengthened by the number of patients examined, inclusion of patients from institutions around the world, and lack of patient exclusion based on RCC histology or type of targeted agent.

Phase III Trial of Vinflunine Plus Best Supportive Care
Compared With Best Supportive Care Alone After a
Platinum-Containing Regimen in Patients With Advanced
Transitional Cell Carcinoma of the Urothelial Tract

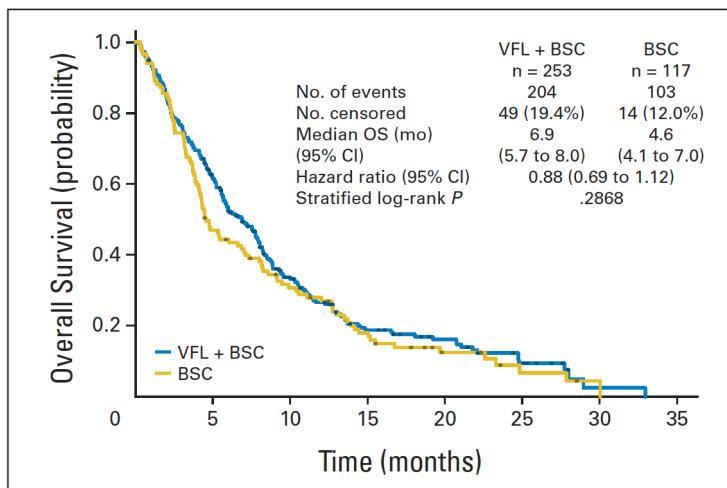

Fig 2. Overall survival (OS) in the intent-to-treat population ($n = 370$). VFL, vinflunine; BSC, best supportive care.

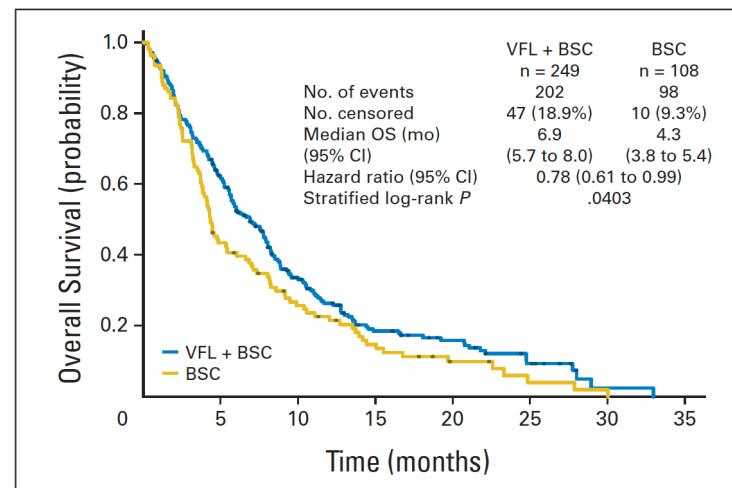

Fig 3. Overall survival (OS) in the eligible population ($n = 357$; 96.5% of intent-to-treat population). VFL, vinflunine; BSC, best supportive care.

Although the objective of the median 2-month survival advantage favoring VFL BSC versus BSC was achieved (6.9 v 4.6 months, respectively), this difference was not statistically significant ($P = .287$; Fig 2).

In the eligible population (Fig 3), the objective of achieving a 2-month survival difference in OS between the VFLBSC and BSC arms was met (6.9 v 4.3 months, respectively), and this difference is statistically significant ($P = .040$).

Il Bias

Distorsione dell'effetto di un intervento diagnostico-terapeutico per effetto di una componente estranea al caso:

- selezione dei soggetti da assegnare a uno specifico trattamento, rimozione di alcuni pazienti dall'analisi, analisi non preordinata su sottogruppi di pazienti (*selection bias*)
rimedio: randomizzazione (e stratificazione)
- perdita di pazienti alla valutazione (**attrition bias**)
rimedio: mascheramento
- conoscenza da parte del paziente/medico/valutatore del trattamento in atto (*performance/detection bias*)
rimedio: mascheramento
- selezione dei risultati da comunicare a mezzo presentazione/pubblicazione (*reporting bias*)

Can trial quality be reliably assessed from published reports of cancer trials: evaluation of risk of bias assessments in systematic reviews

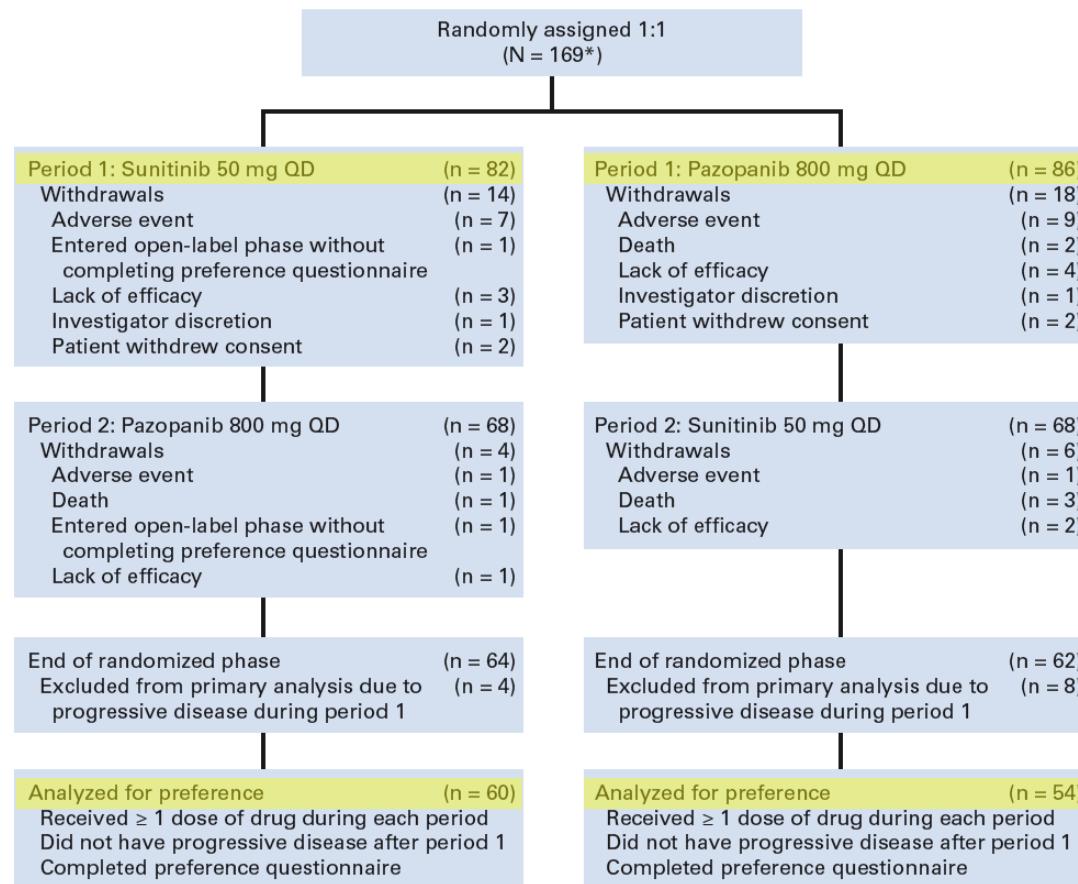

Claire L Vale *senior research scientist*, Jayne F Tierney *senior research scientist*, Sarah Burdett *senior research scientist*

BMJ 2013;346:f1798 doi: 10.1136/bmj.f1798 (Published 22 April 2013)

To evaluate attrition bias, on the basis of whether the outcome data were incomplete or not, the authors had to establish a rule of thumb to ensure consistency between assessments. Trials were assessed as low risk of bias if less than 10% of patients were excluded overall and if similar proportions were excluded from both arms. Trials were judged as high risk of bias if there were considerable imbalances between arms or if more than 10% of randomised patients were excluded from the analysis.

If no patient blinding was performed...

... were they **unbiased** when filling the QoL questionnaire?

If no evaluator blinding was performed...

... was he (totally) **unbiased** when evaluating the scan?

Rischio di bias legato all'assenza di mascheramento

END POINTS AND ASSESSMENTS

The primary end point was progression-free survival, which was defined as the time from randomization to documented disease progression (as evaluated by independent central review by radiologists who were unaware of the treatment assignments) or death from any cause. Secondary end points included the objective response rate, overall survival (defined as the time from randomization to death from any cause), safety, and the side-effect profile.

Basso rischio di Detection Bias
(valutazione indipendente in cieco)

Alto rischio di Detection Bias

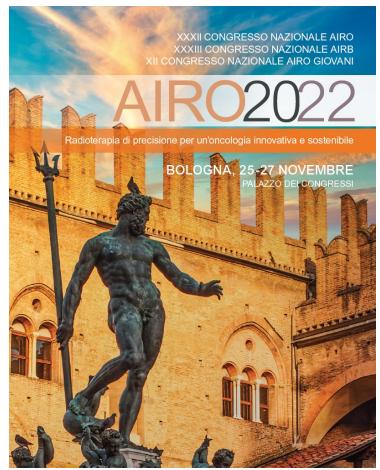

Alto rischio di Performance & Detection Bias

Basso rischio di Detection Bias
(per caratteristica intrinseca dell'outcome)

Long-term oncologic outcomes of postoperative adjuvant versus salvage radiotherapy in prostate cancer: Systemic review and meta-analysis of 5-year and 10-year follow-up data

Ja Yoon Ku¹, Chan Ho Lee¹, Hong Koo Ha^{1,2}

Korean J Urol 2015;56:735-741.

The present systemic review has the following limitations that must be taken into account.

The first limitation is that we heterogeneously recruit randomized controlled studies and retrospective studies: in retrospective studies, the initiation timing of radiotherapy is somewhat different in each study.

The second limitation is that there is a difference in dose and modality (2-dimensional, 3-dimensional, or intensity modulated radiation therapy) of radiation compared to recent practice, which may alter oncologic outcomes.

The third limitation is that patients were different in each study, and the long-term outcome became available at different times.

Criteria for considering studies for this review
Types of participants

Randomised controlled trials were included with no time limit.
Types of participants
Adults engaged in normal daily activities were included. Drowsiness as defined by the trial authors, including described symptoms of drowsiness, reduced alertness, fatigue or lowered mood. Participants could be regular users of caffeine or non-users.

Participants must have been in a normal state of arousal, including those suffering from symptoms such as fatigue, decreased alertness or increased stress. Participants under chronic sleep-deprivation or taking other stimulants were excluded.

Participants with any psychopathology, including depression, anxiety, panic disorder, chronic fatigue or postviral syndrome were excluded.

Types of interventions
Any preparation or dosage of caffeine; tea; cola; chocolate; food, in single or multiple comparisons could be used. Comparisons could include other interventions.

Types of outcome measures
Primary outcomes
The primary outcome was drowsiness (including fatigue, lethargy). Outcomes could be measured at baseline and after intervention.

Secondary outcomes
Secondary outcomes included secondary outcomes (including irritability, stress, depression) and adverse events.

- Psychological state (including attention, reaction time or memory)
- Alertness
- Cognitive performance (including headaches, anxiety, sleep disturbance, heart palpitations, or psychotic features)
- Adverse outcomes (including head pain, heart palpitations, or psychotropic drug side effects)

Analisi per sottogruppi

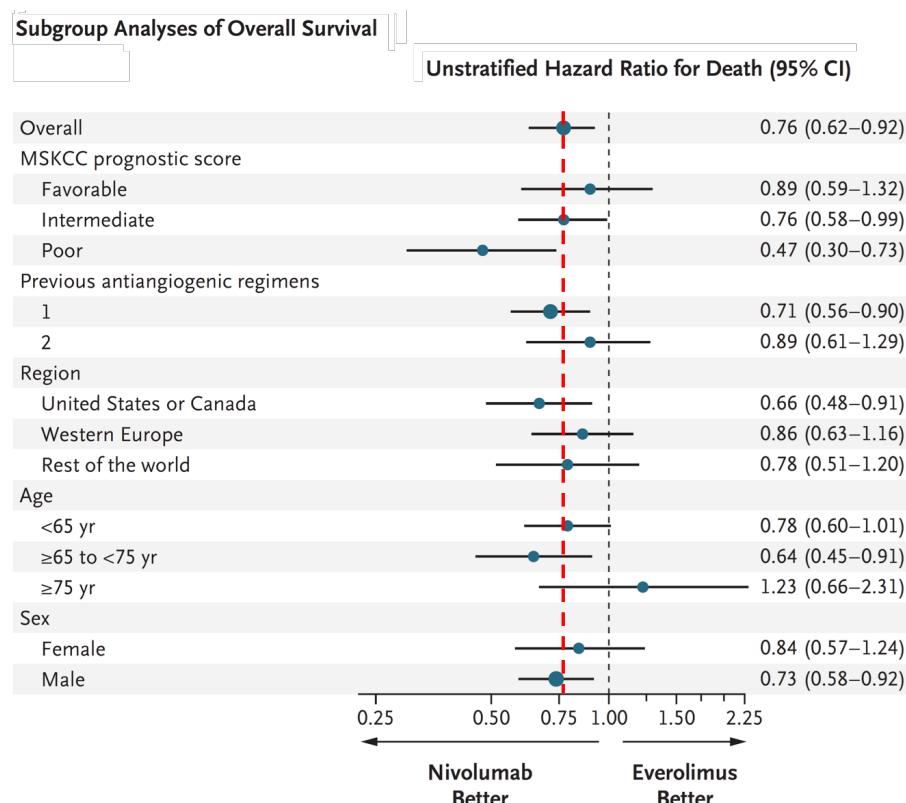

ANALISI PER SOTTOGRUPPI

- Il campione originale viene suddiviso in vari strati (**sottogruppi**) contraddistinti da caratteristiche peculiari.
- Tipologia di analisi:
 - ***Post hoc*** (analisi retrospettiva)
 - ***Pre-specified (preannunciata)*** (prevista dal protocollo di studio; criterio di stratificazione?)
 - ***Pre-planned (prepianificata)*** (prevista dal protocollo di studio con piano di analisi specifico)

Nivolumab versus Everolimus in Advanced Renal-Cell Carcinoma

R.J. Motzer, B. Escudier, D.F. McDermott, S. George, H.J. Hammers, S. Srinivas, S.S. Tykodi, J.A. Sosman, G. Procopio, E.R. Plimack, D. Castellano, T.K. Choueiri, H. Gurney, F. Donskov, P. Bono, J. Wagstaff, T.C. Gaurer, T. Ueda, Y. Tomita, F.A. Schutz, C. Kollmannsberger, J. Larkin, A. Ravaud, J.S. Simon, L.-A. Xu, I.M. Waxman, and P. Sharma, for the CheckMate 025 Investigators*

N Engl J Med 2015;373:1803-13.

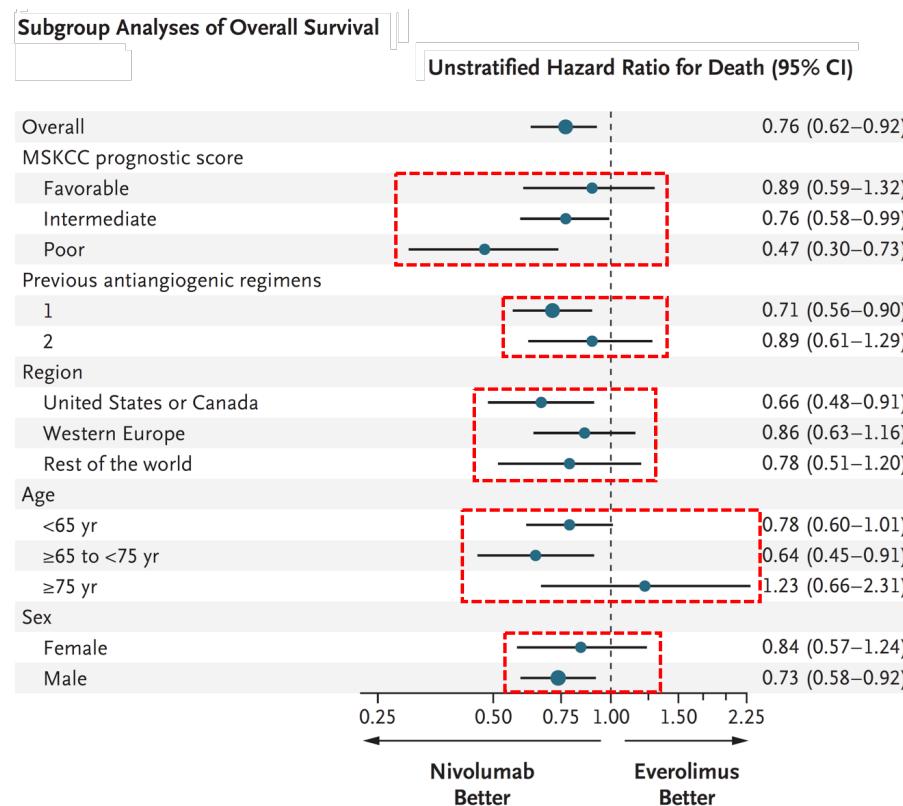

Il riferimento non è (più) la linea di non-effetto, bensì la linea tracciata in corrispondenza dell'effetto osservato sull'intero campione...

... un trattamento non dovrebbe essere limitato / escluso in una specifica sottopopolazione (solo) sulla base di un LC95% al di là (al di qua) della linea di non-effetto!

Nivolumab versus Everolimus in Advanced Renal-Cell Carcinoma

R.J. Motzer, B. Escudier, D.F. McDermott, S. George, H.J. Hammers, S. Srinivas, S.S. Tykodi, J.A. Sosman, G. Procopio, E.R. Plimack, D. Castellano, T.K. Choueiri, H. Gurney, F. Donskov, P. Bono, J. Wagstaff, T.C. Gaurer, T. Ueda, Y. Tomita, F.A. Schutz, C. Kollmannsberger, J. Larkin, A. Ravaud, J.S. Simon, L.-A. Xu, I.M. Waxman, and P. Sharma, for the CheckMate 025 Investigators*

N Engl J Med 2015;373:1803-13.

The **heterogeneity** of the treatment effect within each subgroup shown in Figure 2A was **tested with** the use of an **interaction test** in a Cox proportional-hazards model with treatment, subgroup, and treatment-by-subgroup interaction as covariates. **None of the interaction terms were significant at the 0.05 level.**

Potenziali problemi...

- **High Risk of Bias** (sottogruppo non oggetto di stratificazione)
- **Multiplicity** (*type I error inflation* dovuta a confronti ripetuti)
- **Imprecision** (LC95% compatibili con interpretazioni cliniche di segno opposto)

Only one thing is
worse than doing
subgroup analyses...
believing the results!

R. Peto
